

Share of OECD economies in global GDP broadly stable at 46% in 2021 compared to 2017

The International Comparison Program (ICP) released its 2021 and revised 2017 results today. The ICP is a worldwide statistical partnership which produces purchasing power parities (PPPs) and comparative price levels for participating economies to compare their size of Gross Domestic Product (GDP) and its main components internationally, taking account of differences in price levels.

The economies of the current 38 OECD member countries accounted for about 46% of world GDP in 2021, broadly stable compared to 48% in 2017 (Figure 1). More generally, shares of regions in world GDP did not change substantially between 2017 and 2021.

In 2021, China, the United States and India continued having the biggest GDP in the world, representing 19%, 15.5% and 7.2% of world GDP, respectively, expressed in PPPs (Figure 2 and Table 1). Within the OECD, the distribution of countries remained broadly the same between 2017 and 2021, with the United States, Japan, Germany, France, and the United Kingdom being the largest OECD economies (Figure 3).

In terms of GDP per capita, Luxembourg remains the leader among OECD countries with 138 000 USD PPP in 2021, which reflects, however, a large share of cross-border workers. Some countries ranked lower relative to their OECD peers in 2021 compared to 2017. For instance, Iceland moved from the group of top six to a significantly lower position and Japan and Spain's per capita GDP moved from around the median to around the lower third of OECD countries (Figure 4). On the other hand, Czechia, Slovenia, and Lithuania moved up, closer to OECD median.

In terms of Actual Individual Consumption (AIC) per capita, a better-suited measure of material welfare covering goods and services consumed by households, the United States remained the top OECD country in 2021 with almost 53 000 USD PPP, followed by Luxembourg and Norway. Compared to 2017, some Nordic countries, notably Denmark and Sweden, as well as some Central and Eastern European countries e.g., Lithuania, Slovenia or Poland moved up relative to other OECD countries in 2021. Canada, Australia, the United Kingdom, Israel, and Greece, on the other hand, moved further away from top OECD performers in 2021.

GDP price level indices, i.e., ratios of PPPs to a country's exchange rate and indicators of a country's relative price level, were higher than world average in 24 OECD countries in 2021 (Table 1). This means that these countries were more expensive than average world country.

Figure 1 – Share in world GDP by region, revised 2017 and new 2021 results

Share in world GDP in current USD PPP

Note: The OECD region for all periods contains the current 38 OECD member countries, as of May 2024. The non-OECD countries participating in ICP are divided into regional groups according to the country groupings used by the World Bank (except Bermuda that is assigned to the Latin America and Caribbean region) available here: <https://datahelpdesk.worldbank.org/knowledgebase/articles/906519-world-bank-country-and-lending-groups>.

Figure 2 – Share in world GDP in 2021, world regions and biggest economies

Share in world GDP in current USD PPP, per cent

Note: Only countries with share in world GDP of at least 1.2% are shown.

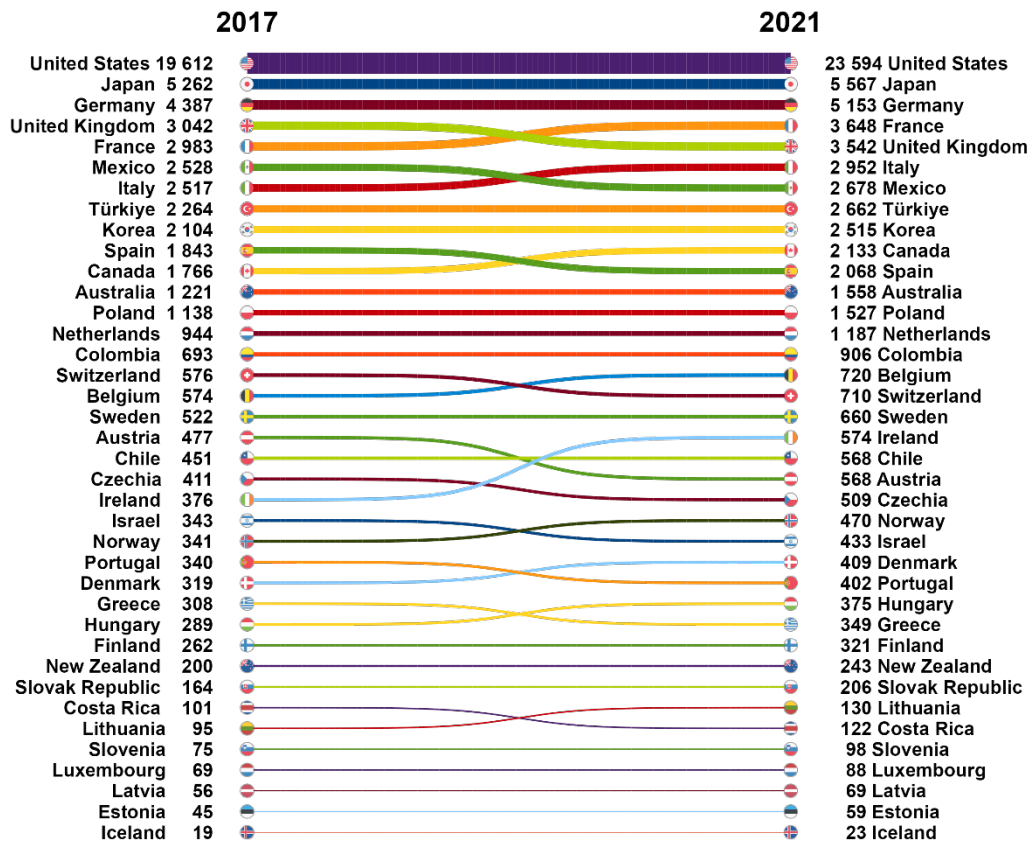

Due to the level of uncertainty associated with the basic price and national accounts data, and the methods used for compiling PPPs, the differences between countries that have results within a close range should not be over-interpreted.

The OECD region for all periods contains the current 38 OECD member countries, as of May 2024. The non-OECD countries participating in ICP are divided into regional groups according to the country groupings used by the World Bank (except Bermuda that is assigned to the Latin America and Caribbean region) available here: <https://datahelpdesk.worldbank.org/knowledgebase/articles/906519-world-bank-country-and-lending-groups>.

Information about the International Comparison Program (ICP) and the Eurostat-OECD PPP Programme:

The ICP is a worldwide statistical partnership with the aim to produce purchasing power parities (PPPs) and comparative price levels for participating economies that make it possible to compare economic output and material welfare across countries. PPPs are estimated using prices of items of a common and comprehensive basket of goods and services, and expenditure shares on groups of items in each country. Hence, they are a conversion rate that controls for different price levels across countries. The Eurostat-OECD Programme is part of the ICP, producing and disseminating results for 48 EU and OECD member countries and for their associate non-member countries. At present, the OECD part of the programme covers 12 member countries: Australia, Canada, Chile, Colombia, Costa Rica, Israel, Japan, Korea, Mexico, New Zealand, the United Kingdom and the United States. In addition to their Programme countries, the Eurostat-OECD also supported the participation of Georgia and Ukraine in the ICP.

Along with the release of 2021 PPP results, the results for previous reference year 2017, as well as 2018-2020 estimates have been revised.

Due to the level of uncertainty associated with the basic price and national accounts data, and the methods used for compiling PPPs, the differences between countries that have results within a close range should not be over-interpreted.
