Foreword

Revenue Statistics in Asian and Pacific Economies is a joint publication by the OECD Centre for Tax Policy and Administration, the OECD Development Centre with the co-operation of the Asian Development Bank (ADB), the Pacific Islands Tax Administrators Association (PITAA), and the Pacific Community (SPC) and the financial support of the European Union and the Government of Japan. It presents detailed, internationally comparable data on tax revenues for 17 Asian and Pacific economies (Australia, the Cook Islands, Fiji, Indonesia, Japan, Kazakhstan, Korea, Malaysia, New Zealand, Papua New Guinea, the Philippines, Samoa, Singapore, the Solomon Islands, Thailand, Tokelau and Vanuatu) and on non-tax revenues for 5 Pacific economies (the Cook Islands, Papua New Guinea, Samoa, Tokelau and Vanuatu). Four of these economies are OECD members (Australia, Korea, Japan and New Zealand). The approach used in Revenue Statistics in Asian and Pacific Economies is based on the well-established methodology of the OECD Revenue Statistics (OECD, 2018), which has become an essential reference source for OECD member countries. Comparisons are also made with the averages for OECD economies, Latin American and Caribbean (LAC) countries and 21 African countries.

In this publication, the term “taxes” is confined to compulsory, unrequited payments to general government. As outlined in the Interpretative Guide to the Revenue Statistics, taxes are “unrequited” in the sense that benefits provided by government to taxpayers are not normally in proportion to their payments. The OECD methodology classifies a tax according to its base: income, profits and capital gains (classified under heading 1000), payroll (heading 3000), property (heading 4000), goods and services (heading 5000) and other taxes (heading 6000). Compulsory social security contributions paid to general government are treated as taxes, and are classified under heading 2000. Greater detail on the tax concept, the classification of taxes and the accrual basis of reporting is set out in the Interpretative Guide in Annex A.

Information is also presented on non-tax revenues in five Pacific economies. The term “non-tax revenue” includes all general government revenue that does not meet the OECD definition of tax revenues. Non-tax revenues include grants (e.g. foreign aid), returns on government market investments, rents on the extraction of resources from public lands, sales of government-produced goods and services, and the collection of fines and forfeits. More details on the definition of these revenues are available in Annex B.

Chapter 1 of this report provides an overview of the main tax revenue trends in the 17 economies and non-tax revenue trends in the 5 relevant Pacific economies from 2007 to 2017. A special feature on tax administration operations is found in Chapter 2, while Chapter 3 contains comparative tables on the level and structure of taxation in the 17 economies since 1990. Chapter 4 contains detailed information on tax revenues on a country-by-country basis. Chapter 5 includes information on the level and structure of non-tax revenues in selected Pacific economies.

Acknowledgements

Revenue Statistics in Asian and Pacific Economies is jointly produced by the Organisation for Economic Co-operation and Development (OECD)'s Centre for Tax Policy and Administration (CTP) and the OECD Development Centre (DEV) with the co-operation of the Asian Development Bank (ADB), the Pacific Islands Tax Administrators Association (PITAA), and the Pacific Community (SPC) and the financial support of the European Union and the government of Japan. The partners would like to thank PITAA and the ADB for co-organising with the OECD a technical workshop in Nadi, Fiji on 3-4 April 2019, with financial support from the European Union. PITAA and SPC have also provided invaluable support and advice. The staff with responsibility for producing the publication were: Kensuke Tanaka, Head of Asia Desk, Jingjing Xia, Statistician, Prasiwi Ibrahim, Economist, and Alexander Pick, Co-ordinator at the OECD Development Centre under the supervision of the Director of the Development Centre and Special Advisor to the OECD Secretary-General on Development, Mario Pezzini; Michelle Harding, Head, Tax Data and Statistical Analysis, Emmanuelle Modica, Statistician/Analyst, Leonie Beisemann, Statistician, Talita Yamashiro Fordelone, Advisor and Osamu Yoshida, Deputy Head, Global Relations of the OECD Centre for Tax Policy and Administration under the supervision of the Director Pascal Saint-Amans, Deputy Director Grace Perez-Navarro and the Head of the Tax Policy and Tax Statistics Division David Bradbury. The special feature benefited from useful inputs, based on "A Comparative Analysis of Tax Administration in Asia and the Pacific 2018 Edition" from the Asian Development Bank (ADB), provided by Yasushi Suzuki, Public Management Specialist. Inputs were also provided by Rahmalia Devita, Intern at the Asia Desk, OECD Development Centre. Elizabeth Nash, Delphine Grandrieux, at DEV and Marie-Aur lie Elkurd at CTP assisted with the production and publication of this report and Stephanie Coic produced the cover.

The authors would like to thank other officials for their invaluable help in completing this publication. Support was also provided by Piera Tortora, Economist/Policy Analyst at the OECD Development Co-operation Directorate; Policy Officer Vincent Bigot, Head of Domestic Revenue Mobilisation Sector, Stefan Agne Head of Budget Support, Public Finance Management, Domestic Revenue Mobilisation Unit Erica Gerretsen at the European Commission; Team leader Economic Cooperation and Agriculture Section Emmanuelle Guiheneuf, Programme Manager Budget Support Marga Peeters, and Programme Manager Economic Cooperation and Agriculture Section Shaleshni Prasad at the Delegation of the European Union for the Pacific; Donghyun Park, Principal Economist, ADB; Nilima Lal, Economic Statistics Advisor at the SPC; Koni Ravono, Head of Secretariat, and Petero Maiucevuce, Training Coordinator at PITAA; as well as Koichoro Aritoshi, Rokiah Bakar, Assel Baltabayeva, Dariya Bissengaliyeva, Gil Beltran, Rowena Sta Clara, Meirbekov Daniyar, Kenneth Lee, Zhi Wei Lim, Datuk Haji Mohd Esa Abd Manaf, Mohammad Reezal Ahmad, Brian McAuley, Teresa Mendoza, Amir Abdul Mutalib Shaari, Rena Nagayama, Hui Li Ng, Kunta Nugraha, Kumara Candra, Ratri Raden, Punjung Raras, Rita Helbra Tenrini, Tuti Sariningsih Budi Utami, Jiehui Shen, Hiroto Sugano, Adzhar Sulaiman, Joanne Tan, Mui Choo Teng, Suryani

Widarta, Zarina Yerkebayeva, Dauren Zakumbayev, Marsidi Zelika, Tearii Maurangi, Xavier Mitchell, Shiri Gounder, Shavindra Nath, Hiyemute Waine, Andrew Bryan Tafua Stratton, Gibson Sanau, Ezekiel Tuke, Doudan Vunagi, Sarah Wickham, Ajchara Chidkrue, Inthu-on Whangprasert, Iapi Jasperse, Alan Shaw, Collins Gesa and George Brechtefeld. The authors are also very grateful to all participants at the technical workshop in Nadi, Fiji in April 2019 as well as to colleagues working in national governments with whom they consulted regularly.

This document was produced with financial support from the European Union. The views expressed herein can in no way be taken to reflect the official opinion of the European Union or of its member countries.

Executive summary

In light of the United Nations' 2030 Agenda for Sustainable Development, awareness of the need to mobilise government revenue in developing countries to fund public goods and services is increasing. *Revenue Statistics in Asian and Pacific Economies* presents key indicators to track progress on domestic resource mobilisation and to inform tax policy and reform.

Revenue Statistics in Asian and Pacific Economies presents detailed, internationally comparable data on tax revenues for 17 Asian and Pacific economies (Australia, the Cook Islands, Fiji, Indonesia, Japan, Kazakhstan, Korea, Malaysia, New Zealand, Papua New Guinea, the Philippines, Samoa, Singapore, the Solomon Islands, Thailand, Tokelau and Vanuatu) and on non-tax revenues for five Pacific economies (the Cook Islands, Papua New Guinea, Samoa, Tokelau and Vanuatu). The report also includes a special feature on tax administration operations.

Tax-to-GDP ratios in Asian and Pacific economies

In 2017, tax-to-GDP ratios in the Asia and Pacific region ranged from 11.5% in Indonesia to 32.0% in New Zealand. The tax-to-GDP ratio refers to total tax revenue, including social security contributions, as a percentage of gross domestic product (GDP). All economies in this publication had lower ratios in 2017 than the OECD average of 34.2%, whereas eight of the economies included in this publication had tax-to-GDP ratios above the Latin American and the Caribbean (LAC) average of 22.8%.

Six of the eight Asian countries covered in this publication had a tax-to-GDP ratio below 18% (the exceptions being Japan and Korea) whereas six of the nine Pacific economies had a tax-to-GDP ratio above 24% (the exceptions being Papua New Guinea, Tokelau and Vanuatu).

Since 2016, nearly two-thirds of the economies included in this publication for which 2017 data is available experienced increases in their tax-to-GDP ratios. The largest increases were seen in Fiji and Vanuatu (1.7 percentage points and 1.9 percentage points, respectively). Three other economies (Kazakhstan, the Solomon Islands and Singapore) had increases greater than 1.0 percentage point. Most of the decreases were comparatively small: Malaysia and Papua New Guinea experienced the largest decreases between 2016 and 2017 (a decrease of 0.7 percentage points for both countries).

Eleven economies included in the publication have increased their tax-to-GDP ratios over the last decade, with the exception of Australia, Indonesia, Kazakhstan, Papua New Guinea, New Zealand and Vanuatu. The highest increases between 2007 and 2017 were observed in Fiji and the Solomon Islands (4.4 and 4.5 percentage points, respectively), primarily due to increases in revenue from income tax and other taxes on goods and services in both

countries. Across the same period, Kazakhstan and Papua New Guinea experienced the largest decreases in their tax-to-GDP ratios (9.7 and 7.0 percentage points, respectively), driven in both cases by decreases in corporate income tax (CIT) revenues. These are attributed to the impact of declining prices of natural resources (during the global financial crisis and in 2014-15) on the profitability of companies in the mining and oil sector in both countries, as well as to a reduction of CIT rates in Kazakhstan.

Tax structures in Asian and Pacific economies

Economies in Asia and the Pacific rely predominantly on goods and services taxes and on income taxes. In nine economies in this publication (the Cook Islands, Fiji, Indonesia, Kazakhstan, the Philippines, Samoa, the Solomon Islands, Thailand and Vanuatu), taxes on goods and services accounted for the largest share of tax revenues in 2017. Within goods and services, VAT/GST is an important and increasing source of revenues in most economies. VAT/GST revenue ranged from 12.9% of total tax revenue in Australia (2016 figure) to 44.4% of total tax revenue in the Cook Islands (the Solomon Islands and Tokelau do not impose VAT/GST) and was higher as a share of total taxes in the Pacific compared to Asian economies. In the Pacific economies that apply a VAT/GST, it accounted for more than 28% of tax revenues, except in Australia and Papua New Guinea. In contrast, VAT/GST revenue generated less than 25% of total tax revenue in 2017 in all Asian countries except Indonesia.

Income taxes provided the main share of tax revenues in the eight remaining countries with the exception of Japan, where social security contributions (40.4% of total tax revenue, 2016 figure) represented the largest source. Across all economies with the exception of Tokelau (which does not impose CIT) and Vanuatu (which does not impose income taxes), revenues from CIT ranged from 9.1% of total tax revenue in Samoa and 41.5% of total tax revenue in Malaysia in 2017. Three countries with the highest shares of revenue from CIT (accounting for over 26% of total tax revenue) include Kazakhstan, Papua New Guinea and Malaysia. Each is highly reliant on revenues from natural resources, especially the oil and mining sector. In 2017, all Asian countries except Indonesia, Japan and Korea were more reliant on CIT revenues than revenues from personal income tax, whereas the reverse was observed for the Pacific economies (with the exception of Fiji).

Non-tax revenues in selected Pacific economies

This publication includes data on non-tax revenues for five Pacific economies (the Cook Islands, Papua New Guinea, Samoa, Tokelau and Vanuatu). In 2017, non-tax revenues as a percentage of GDP were significant for the Cook Islands, Tokelau and Vanuatu and lower than 6% of GDP in Papua New Guinea and Samoa.

Grants were an important source of revenue in 2017 for all economies for which non-tax revenues are presented. In each economy they exceeded 30% of total non-tax revenues and they were the main source of non-tax revenues for the Cook Islands (65.7%), Papua New Guinea (59.9%), Samoa (51.1%) and Vanuatu (52.2%). Property-related income was the main source of non-tax revenues for Tokelau (62.6%) but also played an important role in the Cook Islands (25.9%) and Papua New Guinea (35.0%); in the Cook Islands and Tokelau, the majority of this income was from fishing rents, while mining dividends were the main contributor in Papua New Guinea.

Special feature: Tax administration operations

A special feature explores tax administration operations across Asian and Pacific economies, drawing on *A Comparative Analysis of Tax Administration in Asia and the Pacific 2018 Edition* (ADB, 2018) to summarise the recommended and observed features of key aspects of the common set of functions undertaken by all revenue bodies in the region. These include registration and identification of taxpayers, taxpayer services, tax return and tax payment processing, verification programmes, dispute resolution, and tax payment collection including enforced return filing and debt collection, and are fundamental to a well-functioning tax system.

Chapter 1

Tax revenue trends in Asian and Pacific economies

In light of the United Nations 2030 Agenda for Sustainable Development, awareness is increasing of the need to mobilise government revenue in developing countries to fund public goods and services. Taxation provides a predictable and sustainable source of government revenue, in contrast with official development assistance and the volatility of non-tax revenues with respect to commodity prices.

This report presents detailed and internationally comparable data on tax revenues in 17 Asian and Pacific economies: Australia, the Cook Islands, Fiji, Indonesia, Japan, Kazakhstan, Korea, Malaysia, New Zealand, Papua New Guinea, the Philippines, Samoa, Singapore, the Solomon Islands, Thailand, Tokelau and Vanuatu; and on non-tax revenues for five Pacific Islands (the Cook Islands, Papua New Guinea, Samoa, Tokelau and Vanuatu). This chapter discusses key tax indicators for this group of economies: the tax-to-GDP ratio, the tax structure and the share of tax revenue by level of government; and non-tax revenue for selected Pacific economies. The discussion is supplemented by detailed information for each economy in Chapters 4 and 5.

1.1. Tax ratios

Tax-to-GDP ratios in 2017

In 2017, tax-to-GDP ratios in the Asia and Pacific region ranged from 11.5% in Indonesia to 32.0% in New Zealand. Eight of the 17 economies had tax-to-GDP ratios above the Latin American and the Caribbean (LAC) average of 22.8% in 2017, and all economies in the publication had lower ratios than the OECD average of 34.2%. All of the Asian countries covered in this publication had a tax-to-GDP ratio below 20%, with the exception of Japan at 30.6% (2016 figure) and Korea at 26.9% respectively. Among the Pacific economies, six of the nine economies included in this publication had a tax-to-GDP ratio above 24%, with the exception of Papua New Guinea (13.7%), Tokelau (14.2%) and Vanuatu (17.1%).

Structural economic factors are a key determinant of tax-to-GDP ratios across economies. These include the importance of agriculture in the economy, openness to trade and the size of the informal economy. Agriculture, for example, is a challenging sector to tax: most people in the agriculture sector in developing economies are on low incomes and many are not registered for tax purposes (PEAKS, 2013^[2]). In addition, agriculture benefits from numerous tax exemptions. For example, Malaysia allows an agriculture allowance to be deducted from profits of eligible businesses (Inland Revenue Board of Malaysia, 2016^[3]) and goods and services related to the agriculture sector are exempt from import duty and excise duty (Ministry of International Trade and Industry, 2016^[4]).

In addition to structural economic factors, tax policy and tax administration settings also strongly influence the level of tax revenues. These include the power of tax administrations, the levels of corruption within these administrations and tax morale (i.e. willingness of people to pay taxes) (OECD, 2014^[5]). For example, (Aizenman, 2015^[6]) found that in Asia, government effectiveness and institution quality are positively correlated with the level

of tax-to-GDP ratio. Finally, in general, GDP-per-capita is also related to tax-to-GDP ratios. Tax-to-GDP ratios tend to be higher in high-income economies, although the relationship is not direct and is less pronounced at lower levels of income due to the influence of other factors. It is in particular less pronounced in Asian and Pacific economies (Figure 1.2).

Figure 1.1. **Tax-to-GDP ratios in Asian and Pacific Economies, 2017**

Total tax revenue as percentage of GDP

Note: The figures do not include sub-national tax revenue for the Cook Islands, Fiji, Malaysia, Papua New Guinea, Samoa and the Solomon Islands.

The averages for Africa (21 countries), for LAC (25 Latin American and Caribbean countries) and the OECD (36 countries) are unweighted. Australia, Japan, Korea and New Zealand are part of the OECD (36) group. Data for Australia, Japan, Korea, New Zealand and the OECD average are taken from. (OECD, 2018_[1]),

Data for 2016 are used for the Africa (21) average, Australia and Japan as the 2017 data are not available.

Source: Table 3.1.

StatLink  <https://doi.org/10.1787/888933962533>

A relatively high share of agriculture in Indonesia's economy (above 10% of GDP) compared to the other Asian countries in this publication as well as a low openness to trade contribute to its low tax-to-GDP ratio, together with high levels of informality (estimated to amount to around 57.6% of employment), tax evasion and narrow tax bases (OECD, 2019_[10]). Indonesia has undertaken reforms to strengthen tax administration, increase tax revenues and reduce its dependence on oil revenues. It has set a goal of increasing its tax-to-GDP ratio to 17% of GDP by 2019 (OECD, 2018_[11]).

These reforms have focused on modernising processes and systems, building human capacity and enhancing the tax administration's integrity (OECD, 2018_[11]). Since 2014, Indonesia has also reformed its social insurance system. It has created or restructured several social security programmes, including work accident insurance, and pensions for formal and non-formal workers. A new health insurance programme for all Indonesians covered 78% of the population in 2018 (OECD, 2019_[10]). Further details are provided below.

Figure 1.2. **Tax-to-GDP ratios and GDP per capita (in PPP) in Asian and Pacific economies, Latin America and the Caribbean, OECD and African countries, 2017**

Note: The y-axis is on a logarithmic scale. The Cook Islands and Tokelau are excluded as GDP per capita data was unavailable for these countries. The purchasing-power-parity (PPP) between two countries is the rate at which the currency of one country needs to be converted into that of a second country to ensure that a given amount of the first country's currency will purchase the same volume of goods and services in the second country as it does in the first. The implied PPP conversion rate is expressed as national currency per current international dollar. An international dollar has the same purchasing power as the U.S. dollar has in the United States. An international dollar is a hypothetical currency that is used as a means of translating and comparing costs from one country to the other using a common reference point, the US dollar (definitions derived from (IMF, 2016^[7]) and (WHO, 2015^[8])).

Box 1.1. Enhancing domestic resource mobilisation in Small Island Developing States through revenue statistics

Small Island Developing States (SIDS) comprise a diverse group of the smallest and most remote economies in the world. They are located across the African, Asian, Latin American and the Caribbean, and Pacific regions. They share a common and unique set of development challenges owing to their small populations and landmasses, spatial dispersion and remoteness from major markets, and exposure to severe climate-related events and natural disasters. With small and undiversified economies, SIDS are highly vulnerable to external shocks, as they rely strongly on the global economy for financial services, tourism, remittances and concessional finance.

One common challenge faced by SIDS is the achievement of adequate domestic resource mobilisation and debt sustainability. Domestic revenues are often erratic due to narrow economic productive bases, often concentrated in sectors that are exposed to external fluctuations, such as natural resources or tourism. At the same time, SIDS typically have large current expenditures, as the high unit costs of providing services to small and scattered populations increase public sector expenditures above the average levels of other developing countries (29% of GDP in SIDS, compared to 22% in other developing countries in 2014 (Horscroft, 2014^[12])). Severe climate events and natural disasters also tend to have heavy fiscal and economic impacts. These factors lead to high levels of public debt for many SIDS (57% of GDP compared to 47% for all developing countries in 2015) and reduce the fiscal space to invest in development.

Box 1.1. Enhancing domestic resource mobilisation in Small Island Developing States through revenue statistics (cont.)

Taxes are an important and more stable source of revenues in many SIDS economies, although economies' ability to raise domestic revenues varies significantly. The *Global Revenue Statistics* publications and database (OECD, 2019^[9]) shows that among the Pacific SIDS, tax-to-GDP ratios ranged from 13.7% in Papua New Guinea to 27.6% in the Cook Islands in 2017. Among African SIDS, Cabo Verde had a tax-to-GDP ratio of 19% and Mauritius of 20% in 2016 (OECD/ATAF/AUC, 2018^[13]). Finally, SIDS in Latin America and the Caribbean had the biggest variation, from Dominican Republic's tax-to-GDP ratio of 13.9% to Cuba's ratio of 40.6% in 2017 (OECD et al., 2019^[14]).

Opportunities exist in many SIDS to expand domestic resource mobilisation and improve the stability of domestic revenues through enhanced management of key sectors, including fisheries, tourism and natural resource extraction. Policies to reduce "leakages" from these sectors – especially tourism – and to support backward and forward linkages with other domestic sectors (e.g. food and agriculture, consumer goods and construction) could expand the taxable production base.

Improving the efficiency of revenue collection, enlarging the tax base and employing efficient tax policies are also essential to increase the resources required to sustain development. The *Global Revenue Statistics* project supports 17 SIDS¹ in these efforts by providing accurate, comparable and detailed data on their tax revenues. This information is essential for tax policy making and administrative reforms, and forms a common evidence base for mutual learning across SIDS on how to scale up domestic resource mobilisation. The OECD is deepening analysis on the role of domestic revenue mobilisation in financing sustainable development in SIDS.

By Piera Tortora and Talita Yamashiro Fordelone, based on *Making Development Cooperation Work for Small Island Developing States* (OECD, 2018^[15]) and on the *Global Revenue Statistics database* (OECD, 2019^[9])

1. The SIDS included in *Global Revenue Statistics* as at July 2019 are: the Bahamas, Barbados, Belize, Cabo Verde, the Cook Islands, Cuba, the Dominican Republic, Fiji, Guyana, Jamaica, Mauritius, Papua New Guinea, Samoa, Singapore, the Solomon Islands, Trinidad and Tobago, and Vanuatu.

The relationship between GDP-per-capita and tax levels across the Asian and Pacific economies in this publication is more varied and less direct than seen across LAC or OECD countries. Five Asian and Pacific economies have broadly similar GDP-per-capita and tax-to-GDP ratios as the majority of LAC countries. Papua New Guinea, Vanuatu and the Solomon Islands have similar per capita levels of income but their tax-to-GDP ratios differ markedly. In contrast, Australia, Japan, Korea and New Zealand have higher per capita income and tax-to-GDP ratios. Finally, Singapore has the highest GDP-per-capita of the 17 economies and one of the lowest tax-to-GDP ratios. The high GDP-per-capita in Singapore results from significant inward flows of foreign direct investment (FDI) due to its attractive business climate and stable political environment (UNCTAD, 2012^[16]); whereas the tax-to-GDP ratio is explained by lower income tax rates (particularly on corporate income) and VAT rates compared to other Asian and Pacific economies (UNESCAP, 2014^[17]).

Changes in tax-to-GDP ratios in 2017

Since 2016, nearly two-thirds of the economies in this publication for which 2017 data is available have experienced increases in their tax-to-GDP ratios (Figure 1.3). Nine economies had higher tax-to-GDP ratios in 2017 relative to 2016, whereas six economies had lower ratios in 2016. The largest increases were seen in Fiji and Vanuatu, at 1.7 percentage points (p.p.) and 1.9 p.p. respectively. Three other economies (Kazakhstan, 1.5 p.p.; the Solomon Islands, 1.1 p.p. and Singapore, 1.0 p.p.) had increases greater than 1.0 percentage point. Most

of the decreases were comparatively small: Malaysia and Papua New Guinea experienced the largest decreases between 2016 and 2017, at -0.7 percentage points for both economies.

Figure 1.3. **Annual changes in tax-to-GDP ratios**
Percentage point change, 2017

Note: The figures do not include sub-national tax revenue for the Cook Islands, Fiji, Malaysia, Papua New Guinea, Samoa and the Solomon Islands.

The averages for LAC (25 Latin American and Caribbean countries) and the OECD (36 countries) are unweighted.

Korea and New Zealand are part of the OECD (36) group. Data for Korea, New Zealand and the OECD average are taken from OECD (2018), *Revenue Statistics 2018*, http://dx.doi.org/10.1787/rev_stats-2018-en-fr.

Data for Australia and Japan are not included as figures for 2017 were not available at the time of publication.

StatLink  <https://doi.org/10.1787/888933962571>

Different factors accounted for the large increases in the tax-to-GDP ratios of Vanuatu and Fiji in 2017. The increase in Vanuatu reflected a recovery of tax revenues after the country was hit by Cyclone Pam in March 2015. After the cyclone, the tax-to-GDP ratio fell from 17.4% in 2014 to 15.3% in 2016, recovering to 17.1% in 2017. In Fiji, the increase of 1.7 percentage points was due to increases in revenue from taxes on goods and services (0.9 percentage points) and from corporate income taxes (0.8 percentage points), driven by:

- Strong economic performance and improved compliance of corporations (Fiji Revenue & Customs Service, 2017_[18]). Tax audits by the Fiji Revenue and Customs Administration allowed recovery of one-off tax debts equivalent to 0.5% of GDP (IMF, 2018_[19]);
- Reforms to the VAT system (e.g. reduction of the number of exemptions and zero-rated products), reducing the underreporting of VAT (Fiji Revenue & Customs Service, 2017_[18]);
- Revenue from the environmental levy, which was introduced in 2016, nearly doubled in 2017.

The decreases in the tax-to-GDP ratios of Papua New Guinea and Malaysia were driven by changes in taxes on corporate income and on goods and services in both countries:

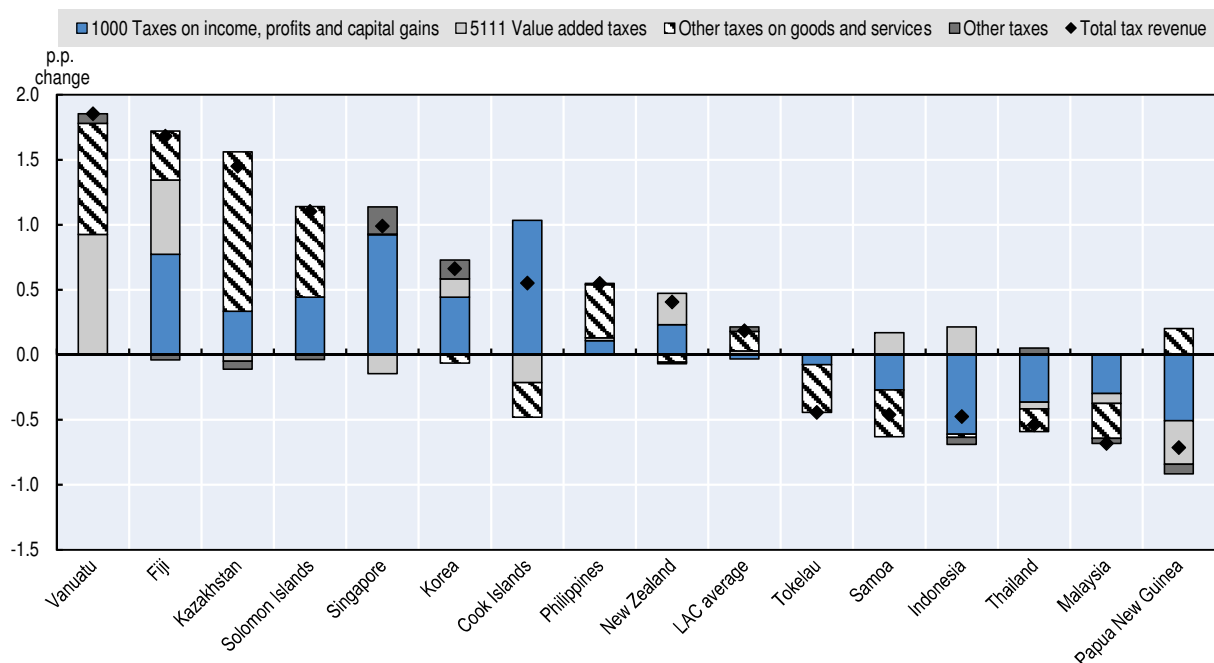

- In Malaysia, revenues from taxes on corporate income and taxes on specific goods and services decreased by 0.2% and 0.3% of GDP respectively. Between 2016 and 2017, nominal GDP growth was double than that of tax revenues. Even though tax revenues increased

in nominal terms in most of the main categories (with the notable exception of taxes on specific goods and services), all decreased as a percentage of GDP between 2016 and 2017. To strengthen tax revenues, the IMF has recommended a number of measures such as broadening the base of personal income tax (PIT), increasing excise rates, implementing a capital gains tax, strengthening the recently reintroduced the sales and services tax (SST)¹ and reviewing tax incentives for corporate investment (IMF, 2018_[20]).

- In Papua New Guinea, revenue from corporate income tax (CIT) decreased by 0.5% of GDP between 2016 and 2017 while VAT revenues decreased by 0.3% of GDP. Between 2016 and 2017, there was a general downturn in economy in Papua New Guinea which lowered oil prices and disrupted the largest mine projects. Shortages in foreign currency negatively impacted business activities (World Bank Group, 2017_[21]).

Figure 1.4. **Net changes in tax-to-GDP ratios between 2016 and 2017**

Percentage point change, by main type of taxes

Note: The figures do not include sub-national tax revenue for the Cook Islands, Fiji, Malaysia, Papua New Guinea, Samoa and the Solomon Islands.

The averages for Africa (21 countries), for LAC (25 Latin American and Caribbean countries) and the OECD (36 countries) are unweighted. Korea and New Zealand are part of the OECD (36) group. Data for Korea, New Zealand and the OECD average are taken from OECD (2018), Revenue Statistics 2018, http://dx.doi.org/10.1787/rev_stats-2018-en-fr.

Data for Australia and Japan are not included as figures for 2017 were not available at the time of publication.

Evolution of tax-to-GDP ratios since 2007

Across a longer time horizon, ten economies in the publication have increased their tax-to-GDP ratios since 2007², whereas seven have not (Australia, Indonesia, Kazakhstan, Malaysia, Papua New Guinea, New Zealand and Vanuatu).

Figure 1.5. **Changes in tax-to-GDP ratios, 2007-17 and 2012-17**

Note: The figures do not include sub-national tax revenue for the Cook Islands, Fiji, Malaysia, Papua New Guinea, Samoa and the Solomon Islands.

The averages for Africa (21 countries), for LAC (25 Latin American and Caribbean countries) and the OECD (36 countries) are unweighted. Australia, Japan, Korea and New Zealand are part of the OECD (36) group. Data for Australia, Japan, Korea, New Zealand and the OECD average are taken from OECD (2018), *Revenue Statistics 2018*, http://dx.doi.org/10.1787/rev_stats-2018-en-fr.

Data for 2016 are used for the Africa (21) average, Australia, Japan and the OECD average.

1. Data for Fiji starts in 2008.

Source: Authors' calculations based on Table 3.1.

StatLink <https://doi.org/10.1787/888933962609>

Across the period, the largest decreases in tax-to-GDP ratios were in Kazakhstan and Papua New Guinea (respectively by 9.7 percentage points and 7.0 percentage points), which were both affected by the fall in mineral resource prices between 2007 and 2017. By contrast, the tax-to-GDP ratios of Fiji, Samoa and the Solomon Islands grew by over 3.0 percentage points over the same period. The change in the tax-to-GDP ratio for the remaining economies ranged from a decrease of 1.9 percentage points in New Zealand and Vanuatu to an increase of 3.0 percentage points in Japan.

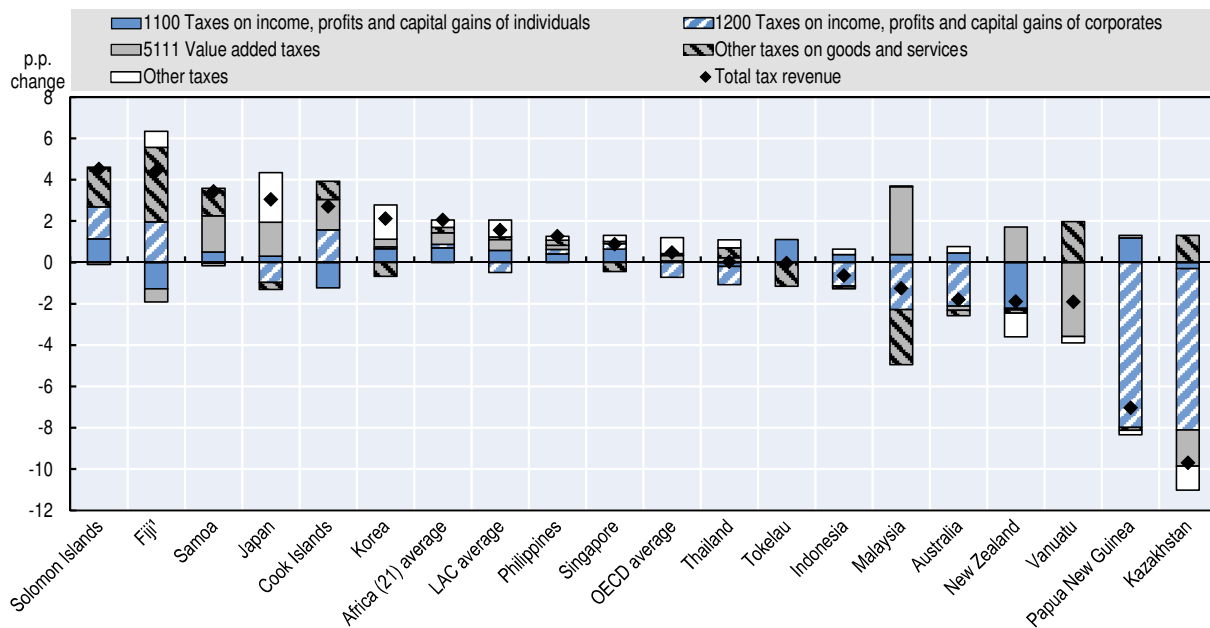

Across the Asian countries included in the publication, the change in tax-to-GDP ratios ranged from -9.7 percentage points in Kazakhstan to 3.0 percentage points in Japan, with three of the Asian countries covered decreasing, four increasing and one country (Thailand) showing no change. Across the Pacific economies in this publication, tax-to-GDP ratio changes ranged from -7.0 percentage points in Papua New Guinea and 4.5 percentage points in the Solomon Islands. The distribution of changes across the period was similar to those of the Asian countries: ratios in four Pacific Island economies decreased; one (Tokelau) had no change; and four increased.

Changes in tax-to-GDP ratios from 2007-17 by tax category

Between 2007 and 2017, CIT revenues were the driver of the major decreases observed in tax-to-GDP ratios in many economies, whereas VAT contributed to several of the increases, although to a lesser extent. These changes reflect a diverse range of policy measures and economic developments in Asian and Pacific economies over this period.

Of the six economies where tax-to-GDP ratios declined between 2007 and 2017, lower CIT revenues contributed in four (the exceptions being Australia and New Zealand). The declines in the tax-to-GDP ratio in Papua New Guinea (7.0 percentage points) and Kazakhstan (9.7 percentage points) both resulted from lower CIT revenues, which declined by around 8.0 percentage points in both. As noted, both economies were strongly affected by declines in natural resource prices. Kazakhstan also reduced its corporate tax rate from 30% in 2008 to 20% in 2009. Malaysia's overall tax-to-GDP ratio declined by 1.3 percentage points between 2007 and 2017 due to a decrease in income tax revenues caused by a fall in petroleum prices and a decrease of the CIT rate over several years, from 27% in 2007 to 24% in 2016 (World Bank, 2016_[22]).

Figure 1.6. Net changes in tax-to-GDP ratios between 2007 and 2017

Note: The figures do not include sub-national tax revenue for the Cook Islands, Fiji, Malaysia, Papua New Guinea, Samoa and the Solomon Islands.

The averages for Africa (21 countries), for LAC (25 Latin American and Caribbean countries) and the OECD (36 countries) are unweighted. Australia, Japan, Korea and New Zealand are part of the OECD (36) group. Data for Australia, Japan, Korea, New Zealand and the OECD average are taken from OECD (2018), *Revenue Statistics 2018*, http://dx.doi.org/10.1787/rev_stats-2018-en-fr.

1. Data for Fiji start in 2008.

Source: Authors' calculation based on: OECD (2019), "Revenue Statistics - Asian and Pacific Economies: Comparative tables", OECD Tax statistics (database).

StatLink  <https://doi.org/10.1787/888933962628>

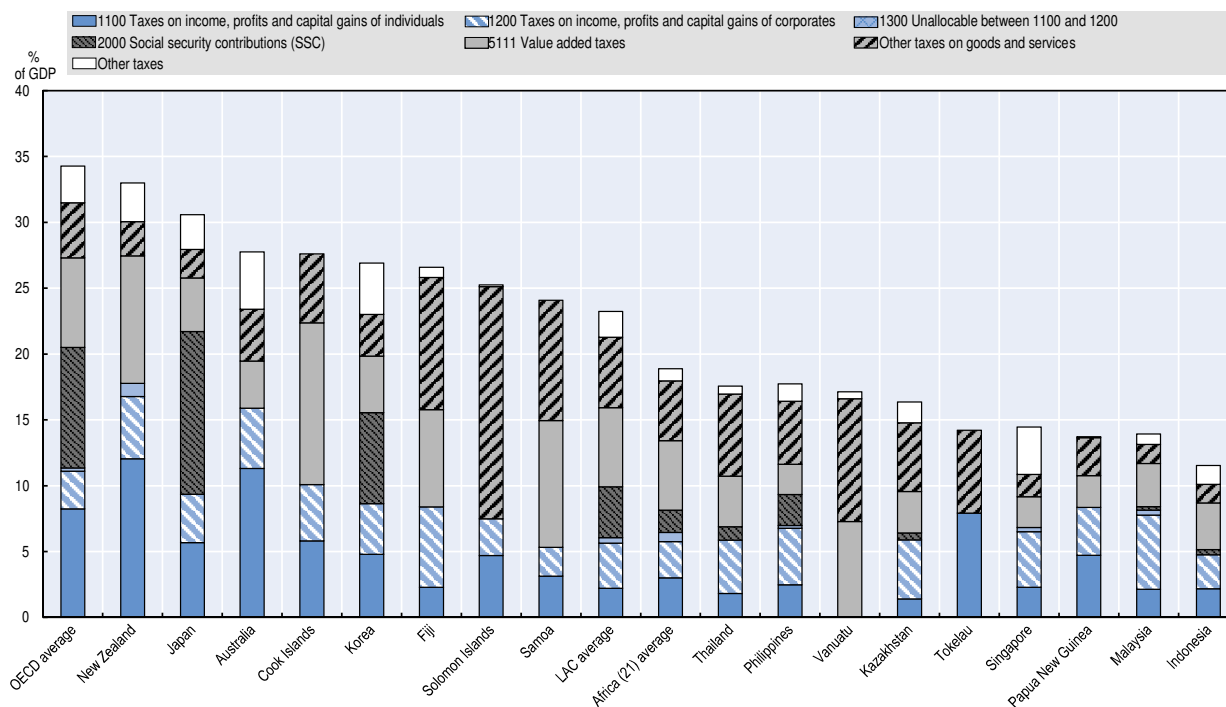

Eight economies recorded increases in their tax-to-GDP ratios between 2007 and 2017. The highest increases were seen in Fiji and the Solomon Islands. Increased revenue from the service turnover tax, the introduction of an environmental levy and a departure tax as well as higher revenue from CIT contributed to the overall increase of the tax-to-GDP ratio in Fiji between 2008 and 2017 (Fiji Revenue & Customs Service, 2017_[18]), (Parliament of the Republic of Fiji, 2018_[23]). The increase of 4.5 percentage points in the tax-to-GDP ratio for the Solomon Islands was mainly driven by increases in other taxes on goods and services (1.9 p.p.) and taxes on income (1.6 p.p. from corporates and 1.1 p.p. from individuals). The growth in revenues from taxes on income can be explained by favourable conditions in the

Solomon Islands' economy. A consistently strong performance of the logging sector, which accounts for over 50% of the country's GDP, contributed to large increases in revenue from export duties (IMF, 2018^[24]).

Levels of revenues from tax categories in 2017 (percentage of GDP)

Looking at the share of individual tax categories, Australia, New Zealand and Tokelau had the highest levels of PIT revenues as a percentage of GDP in 2017. Revenue from PIT equated to 12.1% of GDP in New Zealand and 11.3% of GDP in Australia (2016 figure). Tokelau, with a ratio of 7.9% of GDP, had a similar level of PIT revenue as the OECD average in 2016 (8.2%). In all other Pacific economies covered in this publication, revenue from PIT was above 3.0% of GDP except in Fiji (2.3%) and Vanuatu (which does not have a PIT). In the Asian countries included in this publication, with the exception of Japan and Korea, revenue from PIT in 2017 ranged between 1.4% of GDP in Kazakhstan and 2.5% of GDP in the Philippines.

Figure 1.7. Tax structures as percentage of GDP, 2017

Source: OECD (2019), "Revenue Statistics - Asian and Pacific Economies: Comparative tables", OECD Tax statistics (database).

StatLink  <https://doi.org/10.1787/888933962647>

Revenues from CIT were higher than revenues from PIT in 8 of the 15 economies in this publication for which data was available in 2017. In 2017, CIT revenues ranged from 2.6% of GDP in Indonesia to 5.6% of GDP in Malaysia (excluding Tokelau and Vanuatu, which do not have a corporate tax). The only economies that had corporate tax revenues of more than 5% of GDP were Fiji and Malaysia.

Social security contributions play a small role in the tax revenues of Asian and Pacific economies. Eleven of the economies in this publication, and all Pacific economies, do not levy social security contributions. In the remaining economies, revenue from social security contributions were relatively low in 2017: including in Malaysia (0.3% of GDP), Indonesia (0.4% of GDP), Kazakhstan (0.5% of GDP), Thailand (1.0% of GDP) and the Philippines (2.4% of GDP). These levels are significantly below the LAC average (3.9% of GDP) and the OECD average (9.2% of GDP in 2016). Among the Asian and Pacific economies in this publication, only Korea and Japan have high shares of revenue from social security contributions (6.9% and 12.4% of GDP, respectively).

Although the level of social security contributions remains relatively low in Indonesia (0.4% of GDP), the government has recently undertaken intensive reforms to increase the level of social security contributions:

- A new pension system (Jaminan Pensiun [JP]) was introduced in 2014 and is a compulsory insurance for formal workers in the private sector (OECD, 2019_[10]).
- New institutions responsible for health and employment related social security were created to replace the previous institutions. The Badan Penyelenggara Jaminan Sosial (BPJS) is responsible for policy development, implementation of social security schemes, and monitoring of social security funds. The BPJS has two independent management bodies: the BPJS Kesehatan (Health); and BPJS Ketenagakerjaan (Labour). They began operations in January 2014 and July 2015 respectively (OECD, 2019_[10]).
- The coverage and the contribution rates for these programmes (both for employees and employers) have increased, which has led to higher social security contributions (The United States Social Security Administration, 2018_[25]).

Revenue from taxes on goods and services is below 8.5% of GDP in most Asian countries in the publication, ranging from 4.0% of GDP in Singapore to 8.4% in Kazakhstan. The exception is Thailand, which raised revenues equivalent to 10.1% of GDP in 2017. Revenues from taxes on goods and services in Asian countries are therefore lower than on average in other regions, as represented by the Africa, LAC and OECD averages. In most Pacific economies, taxes on goods and services raised higher levels of revenues, ranging from 12.3% of GDP (New Zealand) to 18.8% of GDP (Samoa). Among Pacific economies, only Australia (7.5% of GDP in 2016) and Tokelau (6.3% of GDP) had revenues from goods and services taxes below 10% of GDP in 2017.

1.2. Tax structures

The tax structure, measured as the composition of tax revenues of different types, is the second key indicator in *Revenue Statistics*. Different taxes have different economic and social effects. Across the 17 economies in this publication, the composition of taxes varies widely, reflecting economies' different policy choices, economic structures and conditions, tax administration capabilities and historical factors.

Tax structures in 2017 and evolution since 2007

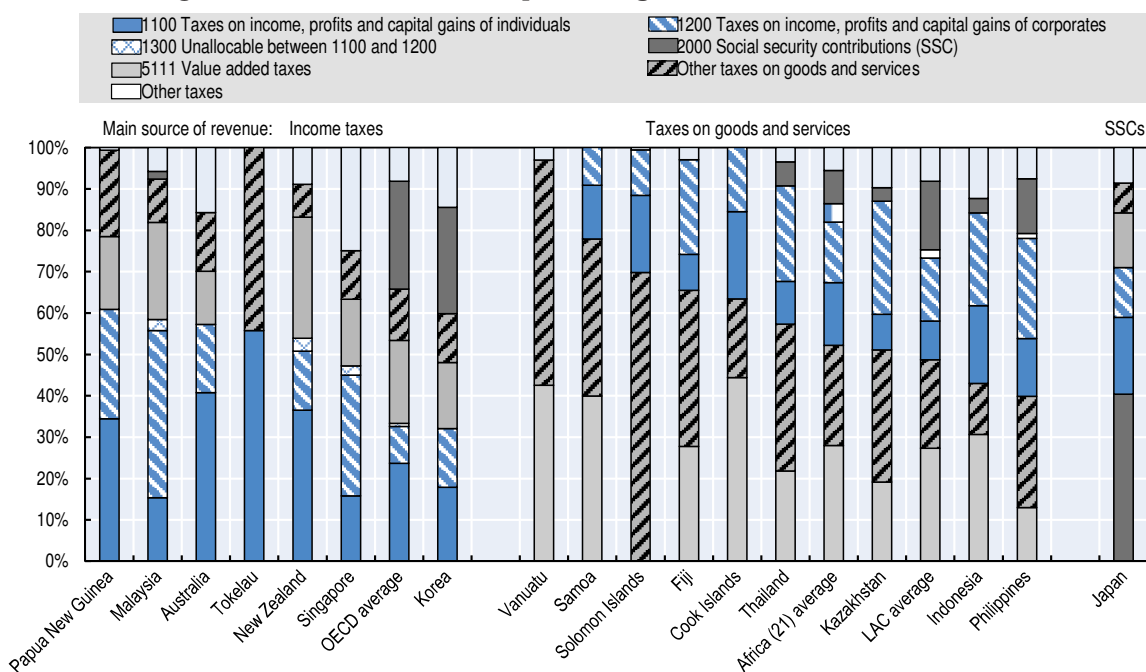

The tax structure of the economies covered in this publication varied greatly in 2017. In nine economies, the main source of tax revenue was taxes on goods and services, while seven economies obtained the primary share of tax revenues from income taxes. Japan is the only country in this group in which the greatest share of revenues was derived from social security contributions.

In 2017, income taxes were the largest source of revenue for Australia, Korea, Malaysia, New Zealand, Papua New Guinea, Singapore and Tokelau. Among these economies, the share of income tax revenues varied from 32.1% in Korea to 60.9% in Papua New Guinea. CIT revenues were higher than PIT revenues in two Asian countries (Malaysia and Singapore), while all Pacific economies in this group (Australia, New Zealand, Papua New Guinea and Tokelau) as well as Korea raised higher shares of revenue from PIT.

Taxes on goods and services were the main source of tax revenue in the Cook Islands, Fiji, Indonesia, Kazakhstan, the Philippines, Samoa, the Solomon Islands, Thailand and Vanuatu in 2017, contributing between 51.1% (Kazakhstan) and 97% (Vanuatu) of total tax revenue. Taxes on goods and services also contributed the largest share of revenues for the LAC and African regions, on average, amounting to nearly 50% of total tax revenue. Within this group of Asian and Pacific economies, revenues from taxes on goods and services other than VAT, such as excises and import duties, were typically higher than VAT revenues, ranging from 19.0% of total tax revenues in the Cook Islands to 69.8% in the Solomon Islands. Among these economies, only the Cook Islands and Samoa received a larger share of revenue from VAT (40.0% and 44.4% of total tax respectively).

As discussed earlier, social security contributions played a small role in revenues for most Asian and Pacific economies, with a few exceptions. Japan derived the largest share of total tax revenues from social security contributions, at 40.4% in 2016. Social security contributions also played a significant role in revenues in Korea (25.7%) and in the OECD on average (26.2% in 2016).

Figure 1.8. Tax structures as percentage of total tax revenue, 2017

Note: The figures do not include sub-national tax revenue for the Cook Islands, Fiji, Malaysia, Papua New Guinea, Samoa and the Solomon Islands.

The averages for Africa (21 countries), for LAC (25 Latin American and Caribbean countries) and the OECD (36 countries) are unweighted. Australia, Japan, Korea and New Zealand are part of the OECD (36) group. Data for Australia, Japan, Korea, New Zealand and the OECD average are taken from OECD (2018), *Revenue Statistics 2018*, http://dx.doi.org/10.1787/rev_stats-2018-en-fr.

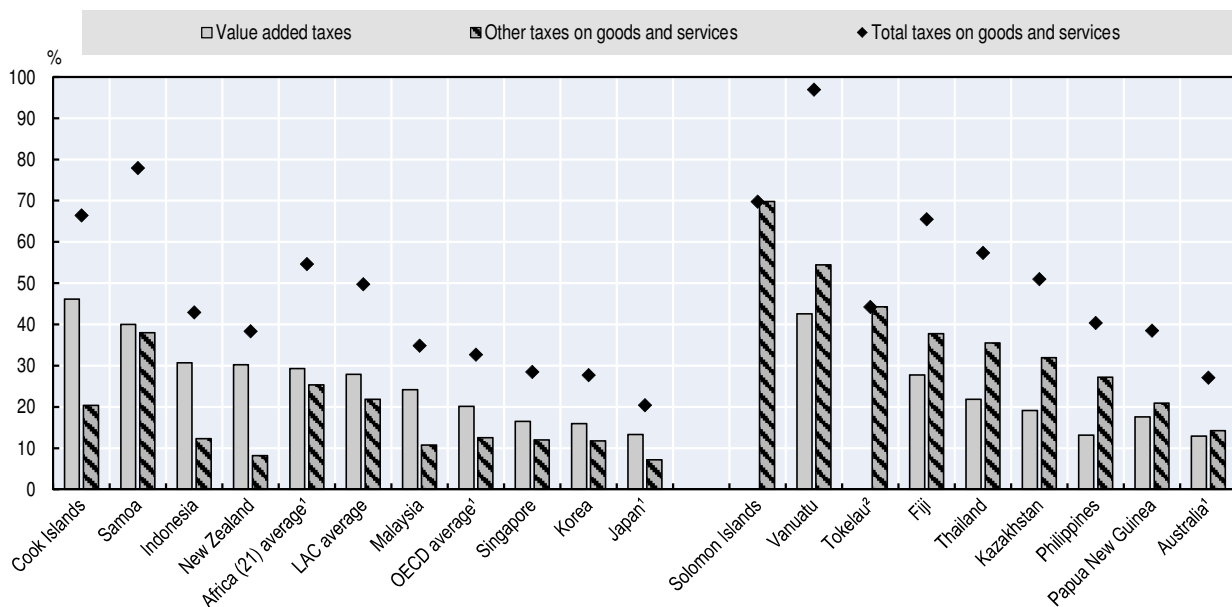

Data for 2016 are used for the Africa (21) average, Australia, Japan and the OECD average.

Source: OECD (2019), "Revenue Statistics - Asian and Pacific Economies: Comparative tables", OECD Tax statistics (database).

StatLink <https://doi.org/10.1787/888933962666>

Across most economies in this publication, VAT is an important and increasing source of revenues. Excluding Tokelau and the Solomon Islands, which do not have value added taxes, VAT revenue ranged from 12.9% of total tax revenue in Australia (in 2016) to 44.4% of total tax revenue in the Cook Islands in 2017. In addition, VAT revenues as a share of total taxes are typically higher in Pacific than in Asian economies. In the Asian countries in this publication, VAT revenue was less than 25% of total tax revenue in 2017 except in Indonesia (ranging from 13.2% in the Philippines to 24.1% in Malaysia). In the Pacific economies that apply a VAT system, only Australia and Papua New Guinea had shares of VAT of less than 25% in 2017 (12.9% and 17.6%, respectively); Vanuatu and the Cook Islands had the largest shares (42.5% and 44.4% of total tax revenues, respectively).

Figure 1.9. **Revenue from value added tax and other taxes on goods and services**

2. The Solomon Islands and Tokelau do not levy value added tax.

Source: OECD (2019), "Revenue Statistics - Asian and Pacific Economies: Comparative tables", OECD Tax statistics (database).

StatLink  <https://doi.org/10.1787/888933962685>

Revenues from other goods and services contributed between 7.1% of total tax revenue in Japan (2016 figure) and 69.8% in the Solomon Islands in 2017. The high share in the Solomon Islands is derived from general taxes on goods and services, such as the goods tax and the sales tax, as the Solomon Islands does not apply a VAT. Shares of non-VAT taxes in total revenue are also comparatively high in Thailand, Fiji, Samoa, Tokelau and Vanuatu, where they are larger than 35% of total tax revenues.

In 2017, revenue from other taxes on goods and services played a more prominent role in the Pacific economies than in Asian countries covered in this publication. Five of the nine Pacific economies generated more revenue from other taxes on goods and services than

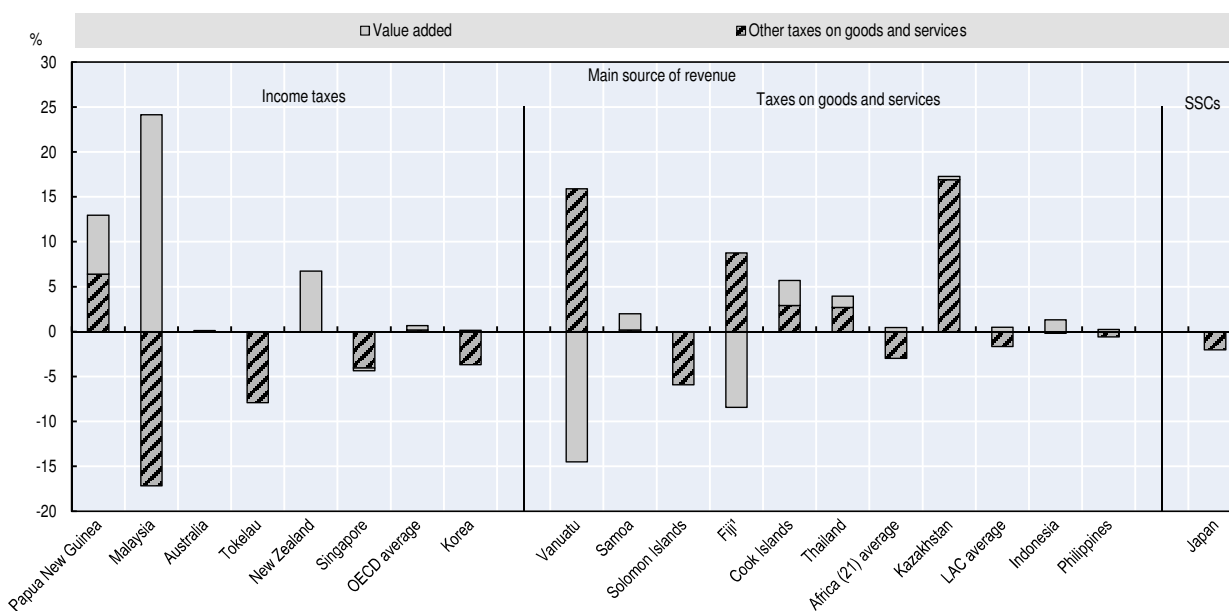

from VAT, whereas five of the eight Asian countries received more revenue from VAT. For the Africa, LAC and the OECD averages, revenue from VAT contributed a larger share to total tax revenue than other goods and services.

Figure 1.10 shows the change in revenue from VAT and other taxes on goods and services between 2007 and 2017. Economies are ordered by their main source of revenue (i.e. taxes on goods and services, income taxes, social security contributions, as shown in Figure 1.8). Several observations emerge:

- Of the nine Asian and Pacific economies that obtain the majority of their tax revenues from taxes on goods and services, five experienced an increase in revenue from non-VAT taxes on goods and services over the period 2007 to 2017. This contrasts with trends observed in the economies whose main share of revenue is derived from income taxes or social security contributions, where revenue from non-VAT taxes declined in most cases.
- The share of VAT in total tax revenues has increased in all but three economies between 2007 and 2017 and the increases can be largely attributed to policy changes. Three economies increased their VAT rate between 2007 and 2017: New Zealand, increasing the rate from 12.5% to 15% in 2010 (OECD, 2012_[26]); Japan, from 5% to 8% in 2014 (OECD, 2014_[27]); and the Cook Islands, from 12.5% to 15% in 2014 (Cook Islands News, 2013_[28]). In addition, Malaysia replaced its sales tax with a VAT at 10% in 2015 (Bloomberg, 2015_[29])³, and VAT revenues increased from 15.8% of total tax revenues in 2015 to 24.1% in 2017.

Figure 1.10. **Changes in revenue from value added tax and other taxes on goods and services**

Percentage of total tax revenue, 2007-17

1. Data for Fiji start in 2008.

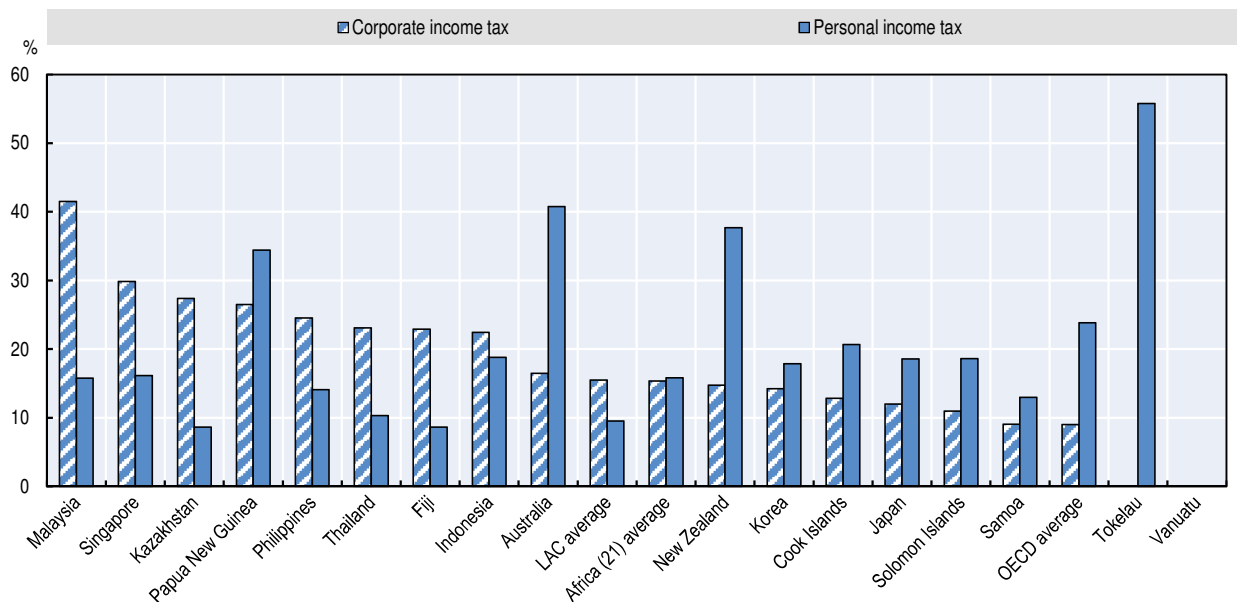

Source: Authors' calculation based on: OECD (2019), "Revenue Statistics - Asian and Pacific Economies: Comparative tables", OECD Tax statistics (database).

StatLink  <https://doi.org/10.1787/888933962704>

The only economies in this publication that experienced a decline in the share of VAT revenues over this period were Fiji, Singapore and Vanuatu. In Fiji, the share of VAT revenue declined by 8.4 percentage points in 2017 to 27.8% of total tax revenue, following a decrease of the VAT rate from 15% to 9% in 2016. Similarly, the share of VAT revenue in Vanuatu declined by 14.5 percentage points in 2017 to 42.5% of total tax revenue due to higher revenue from excises and other taxes on goods and services. The share of VAT revenues to total tax revenue in Singapore declined by 0.3 percentage points between 2007 and 2017.

The composition of income taxes between corporate and personal income taxes also varied in Asian and Pacific economies (Figure 1.11). In 2017, all Asian countries except Japan and Korea had a greater share of CIT revenues relative to PIT. In contrast, all Pacific economies covered in this publication except Fiji had a greater share of PIT than CIT.

Figure 1.11. **Revenue from corporate income tax and personal income tax**
Percentage of total tax revenue, 2017

Note: The figures do not include sub-national tax revenue for the Cook Islands, Fiji, Malaysia, Papua New Guinea, Samoa and the Solomon Islands.

The averages for Africa (21 countries), for LAC (25 Latin American and Caribbean countries) and the OECD (36 countries) are unweighted. Australia, Japan, Korea and New Zealand are part of the OECD (36) group. Data for Australia, Japan, Korea, New Zealand and the OECD average are taken from OECD (2018), *Revenue Statistics 2018*, http://dx.doi.org/10.1787/rev_stats-2018-en-fr.

A small amount of income tax revenue (less than 5%) cannot be allocated to either personal or corporate tax in Malaysia, New Zealand, the Philippines and Singapore as well as the three regional averages (Africa (21) average, LAC average, OECD average).

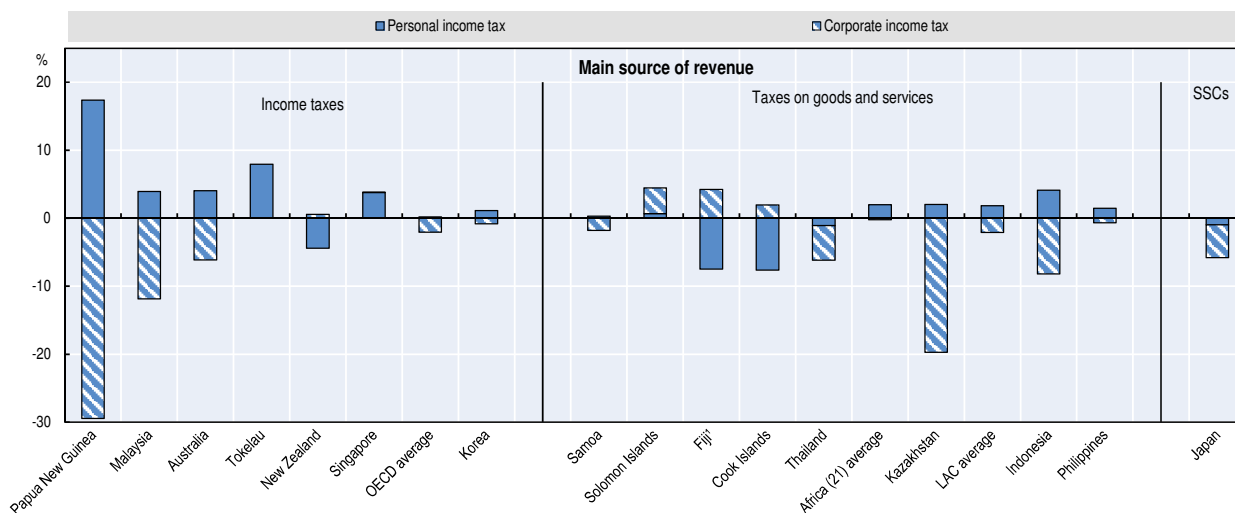

Vanuatu does not levy personal or corporate income tax and Tokelau does not levy corporate income tax.

Source: Authors' calculation based on: OECD (2019), "Revenue Statistics - Asian and Pacific Economies: Comparative tables", OECD Tax statistics (database).

StatLink  <https://doi.org/10.1787/888933962723>

In 2017, revenues from CIT varied between 9.1% of total tax revenue in Samoa and 41.5% of total tax revenue in Malaysia. Three economies with the highest shares of CIT revenues (Kazakhstan (27.4%), Papua New Guinea (26.5%) and Malaysia (41.5%)) received significant shares of CIT revenue from companies in the oil and mining sector. By contrast, revenues from PIT ranged between 7.6% of total tax revenues in Fiji to 40.8% in Australia (2016 figure) and 55.8% in Tokelau. Tokelau does not have a CIT and obtains the majority of its tax revenue from PIT.

Figure 1.12. **Changes in revenue from corporate income tax and personal income tax**
Percentage of total tax revenue between 2007 and 2017

Data for Australia, Japan, Korea, New Zealand and the OECD average are taken from OECD (2018), *Revenue Statistics 2018*, http://dx.doi.org/10.1787/rev_stats-2018-en-fr.

1. Data for Fiji start in 2008.

Source: Authors' calculation based on: OECD (2019), "Revenue Statistics - Asian and Pacific Economies: Comparative tables", OECD Tax statistics (database).

StatLink <https://doi.org/10.1787/888933962742>

Between 2007 and 2017, revenues from CIT were more variable as a share of total tax revenues than revenues from PIT in all economies covered in this publication. The share of CIT revenues was lower in 2017 than in 2007 in ten economies, by between 0.7 p.p. of total tax revenues in the Philippines and 29.4 p.p. in Papua New Guinea (Figure 1.12).

By contrast, the share of revenues from PIT decreased for only four Asian and Pacific economies between 2007 and 2017, and the scale of the decreases was comparatively small, ranging from 1.1 percentage points of total tax revenues in Thailand to 7.6 percentage points in the Cook Islands. Revenue from PIT increased as a share of total taxation for all other economies in this period, from 0.3 percentage points in Samoa to 17.4 percentage points in Papua New Guinea.

Box 1.2. VAT revenue ratios in Asian countries

The VAT revenue ratio (VRR) measures the difference between the VAT revenue collected and what would theoretically be raised if VAT was applied at the standard rate to the entire potential tax base in a "pure" VAT regime and all revenue was collected. A VRR of 1 suggests no loss of VAT revenue as a consequence of exemptions, reduced rates, fraud, evasion or tax planning. This section describes the VRR levels in the Asian countries in this publication.

There was a wide disparity of VRRs in Asian countries in 2016. The Philippines had the lowest VRR ratio at 0.23 and Malaysia and Thailand had the highest at 0.87 and 0.84. Of the countries in this publication, Japan, Korea and Singapore have relatively high VRR (exceeding 0.6), above the OECD average of 0.56. This is partially because of the relatively broad-based VAT in each country: Japan does not have any reduced rates

Box 1.2. VAT revenue ratios in Asian countries (cont.)

while in Singapore, only international services are zero-rated, with the only exemptions applying to the sales and leases of residential properties and to most financial services (MOF, 2017). Korea has a reduced rate on a number of goods and services. In comparison, many OECD countries have one or more reduced rates (OECD, 2016^[49]), which partly explains the lower average VRR in the OECD region.

The VRR needs to be interpreted with caution and can be affected by several factors that inflate it. One reason can be where exemptions on products and services relating to intermediate consumption can lead to a cascading effect that increases VAT revenue (IMF, 2017). For example, in Thailand, excessive exemptions may cause “cascading”, which artificially increases the VRR. Another reason the VRR may be inflated is that refund processes do not work correctly, which may discourage taxpayers from claiming their VAT refunds, resulting in artificially higher VAT revenue and VRR.

Figure 1.13. VAT revenue ratio (VRR) in Asian countries, 2016

Note: OECD average (36 countries) is unweighted. Data for Thailand are for 2015.

1. The VRR measure is currently underestimated as VAT revenue collected at customs is not accounted for in total VAT revenue in this publication (this revenue could not be distinguished from revenue from other import duties and is currently classified under heading 5120 (taxes on specific goods and services)).

Source: VAT rates are sourced from countries, Trading Economics and KPMG websites and OECD (2018). The final expenditure consumption figures from the United Nations Statistics Division website and the OECD Annual National Accounts. The VAT revenues are sourced from the country tables in Chapter 4.

1.3. Taxes by level of government

This section discusses the relative share of tax revenues attributed to different levels of government in 2017: central government, regional or provincial government (including state government, where relevant) and local government as well as social security funds.

In many economies included in this publication, the share of sub-national taxes was comparatively small as a share of total tax revenues in 2017. Shares of sub-national government tax revenue in the Asian countries ranged from 5.1% of total revenues in the Philippines and

8.6% in Thailand to 17.3% in Korea, 23.9% (2016 figure) in Japan and 22.1% in Kazakhstan. In Indonesia, revenues attributed to sub-national governments are rising and were over 10% in 2017, following the shift of property taxation to the local level in 2014. In New Zealand, sub-national government revenues were 6.5% and in Australia subnational revenues (including both state and local tax revenues) amounted to 20.5% of total tax revenues (2016 figure).

The types of taxes levied by local governments vary between countries. Local governments in the Philippines have a narrow range of taxes under their jurisdiction, relying on property taxes and taxes on income and profits. Sub-national governments in Japan and Korea raised revenue from taxes on income and profits, property taxes, taxes on goods and services, payroll (Korea only) and other taxes. The share of sub-national government revenue also depends on the range of services which local governments are expected to provide: for example, local revenues are higher in Japan since local governments finance a wide range of goods and services including public welfare and are responsible for financing some education and debt servicing (Beshho, 2016_[30]).

Between 2000 and 2017, the share of revenues collected by sub-national governments in Asian and OECD countries was stable, with the exception of Indonesia and Kazakhstan. In Indonesia, the share of revenues attributed to sub-national governments increased by 8.2 percentage points, whereas in Kazakhstan the share decreased by 27.7 percentage points.

As social security contributions play a smaller role in total revenues in Asia and the Pacific than in other regions, the share of revenues attributed to social security funds was also low. The proportion of total tax revenues collected by social security funds in Australia, New Zealand and Singapore was zero in 2017, and was under 6% of total revenues in Indonesia, Kazakhstan, Malaysia and Thailand. By contrast, countries that source a greater share of their revenues from social security contributions also had higher shares of revenues attributed to social security funds: at 40.4% of tax revenues in Japan in 2016 and 25.7% in Korea in 2017. The share of tax revenues attributed to social security funds has increased in both Japan (by 5.2 p.p.) and Korea (9.0 p.p.) since 2000.

Table 1.1. Attribution of tax revenues to sub-sectors of general government
Percentage of total tax revenue, 2017

Note: Australia, Japan, Korea and New Zealand are part of the OECD (36) group. Data for Australia, Japan, Korea, New Zealand and the OECD average are taken from OECD (2018), *Revenue Statistics 2018*, http://dx.doi.org/10.1787/rev_stats-2018-en-fr.

The figures do not include sub-national tax revenue for the Cook Islands, Fiji, Malaysia, Papua New Guinea, Samoa and the Solomon Islands.

Data for 2016 are used for Australia, Japan and the OECD average.

1. Sub-national figures in Australia include data of state and local government.

StatLink  <https://doi.org/10.1787/888933962780>

1.4. Non-tax revenues in selected Pacific economies

This publication also includes information on non-tax revenues for selected Pacific economies for which data are available. Non-tax revenues are defined as all revenues received by general government that do not meet the OECD definition of taxes, as set out in the Interpretative Guide (Annex A). They are further divided into five categories according to the definitions set out in Annex B: grants; property income; sales of goods and services; fines, penalties and forfeits; and miscellaneous and unidentified revenues.

Non-tax revenues as a percentage of GDP

Non-tax revenues were equivalent to a significant share of GDP in 2017 for three Pacific economies for which data is available. Non-tax revenues for the Cook Islands and for Vanuatu were around 14.0% of GDP in 2017 whereas they amounted to 177.9% of GDP for Tokelau. The very high level of non-tax revenues in Tokelau, measured as a share of GDP, is due to the fact that non-tax revenues derive primarily from payments by foreign vessels for access to Tokelau's fishing waters. In the 2008 System of National Accounts, these revenues are recorded as part of GNI, but they do not add to GDP. By contrast, non-tax revenues are comparatively low in Papua New Guinea and Samoa (3.7% and 5.5% of GDP in 2017, respectively).

Further, non-tax revenues have been increasing since 2007 for the Cook Islands, Tokelau and Vanuatu, whereas they have been declining as a share of GDP for Papua New Guinea and Samoa. The upwards trend for Tokelau has been driven by the increase in revenues from property income, which is entirely sourced from fishery income. Tokelau receives support from New Zealand to strengthen the management of its Exclusive Economic Zone to maximise Tokelau's revenue collection from its international fisheries (New Zealand Foreign Affairs & Trade, 2018^[31]). Fisheries income also increased after Tokelau became a partner to the Nauru Agreement, which administers the fishing vessel-day scheme (VSD). The VSD is the system to sustainably manage the world's largest tuna fishery in the Western and Central Pacific Ocean and has increased revenue to participating islands by over 500% in the past six years (Parties to the Nauru Agreement, 2016^[32]).

The increase in non-tax revenue for the Cook Islands has been predominantly driven by an increase in grant revenues from New Zealand, Australia and the European Union. This support contributes to upgrading infrastructure, growing sustainable tourism, and supporting initiatives that strengthen the public sector and improve education, health and social services. Increases in non-tax revenues in Vanuatu can be also explained by increases in grant revenue in response to Cyclone Pam in 2015 (causing losses to the economy of over 60% of the GDP (IMF, 2016^[33])) and volcano eruptions in 2017 (causing the evacuation of 11 000 people (MEAE France, 2017^[34])). Besides higher grant revenue, the implementation of the government citizenship programme in Vanuatu also contributed to increases in non-tax revenue in 2017 (Government of Vanuatu, 2017^[35]).

Table 1.2. **Non-tax revenue of main headings as percentage of GDP in selected Pacific economies, 2007-2017**

	2007	2008	2009	2010	2012	2013	2014	2015	2016	2017
Cook Islands	5.6	5.2	9.2	13.5	8.4	14.3	16.2	13.9	16.4	14.0
Papua New Guinea	4.0	4.1	3.5	4.7	3.1	2.4	3.1	3.4	3.5	3.7
Samoa	7.8	10.0	3.6	9.3	4.6	6.7	4.8	4.9	4.8	5.5
Tokelau ¹	149.3	157.6	165.2	154.6	192.6	246.6	173.4	252.5	236.5	177.9
Vanuatu	1.4	6.5	7.0	8.3	5.2	4.2	5.8	14.8	9.6	14.2

1. Tokelau receives significant revenues from foreign vessels for access to Tokelau fishing waters. In the 2008 SNA, these revenues are recorded as part of GNI, but they do not add to GDP

Structure of non-tax revenues

Non-tax revenues are divided into different categories: grants; property income; sales of goods and services; fines, penalties and forfeits; and miscellaneous and unidentified revenues.

In 2017, the shares of each of these categories in total non-tax revenues varied across the five Pacific economies for which this data is included:

- Grants were an important source of revenues for all economies in 2017, exceeding 30% of total non-tax revenues in each. They ranged from 34.9% of non-tax revenues in Tokelau to 65.7% of non-tax revenues in the Cook Islands. In 2017, they were the main source of revenues for the Cook Islands, Papua New Guinea, Samoa and Vanuatu.
- Property income was the main source of non-tax revenues for Tokelau in 2017 (62.6%), whereas it was relatively small for Samoa (5.9%). Property income in Tokelau was derived predominantly from fisheries income (i.e. fishing rents), which represented more than 80% of total property income.

Table 1.3. **Non-tax revenue of main headings as percentage of total non-tax revenues in selected Pacific economies, 2017**

	Grants	Property income	Sales of goods and services	Fines, penalties and forfeits	Miscellaneous and unidentified revenue
Cook Islands	65.7	25.9	5.1	0.3	3.0
Papua New Guinea	59.9	35.0	0.0	0.0	5.0
Samoa	51.1	5.9	33.8	9.2	0.0
Tokelau	34.9	62.6	2.4	0.0	0.0
Vanuatu	52.2	0.0	0.0	0.0	47.8

Notes

1. As of 1 September 2018, the new government replaced the GST with the old system of a sales and services tax (SST). For goods, the rate is set to be between 5-10%, while the tax on services is set at a 6% rate. The new measure came into force following a three-month tax break from June 2018.
2. Data for Fiji are only available from 2008, so the data used for Fiji in this section are from 2008-17. In addition, 2017 data for Australia and Japan are not available in OECD (2018) so data for 2016 are used instead.
3. The current government has subsequently annulled the VAT and reintroduced the Sales and Services Tax (SST) in September 2018.

Chapter 2

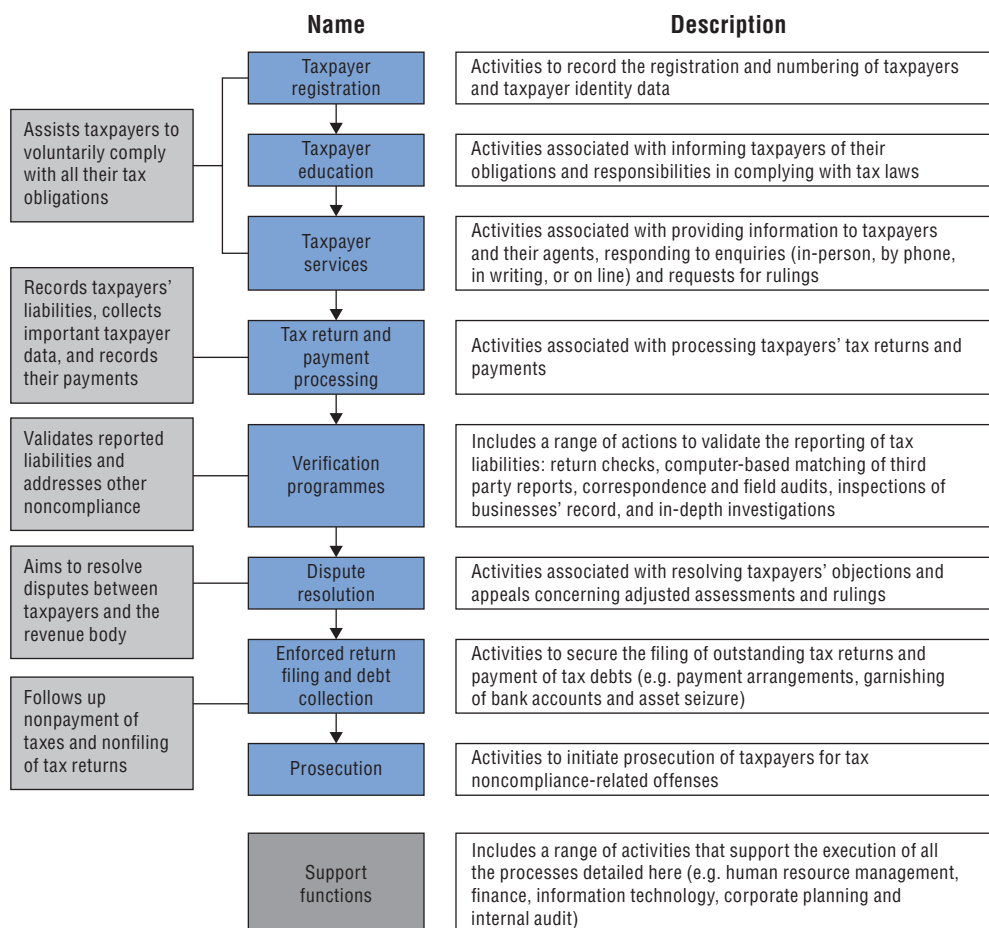

SPECIAL FEATURE

Tax administration operations

There is a common set of functions that must be undertaken by revenue bodies to fully carry out their mandate, regardless of the taxes or the economy in which they are levied. These include registration and identification of taxpayers, taxpayer services, tax return and tax payment processing, verification programmes, dispute resolution, and tax payment collection including enforced return filing and debt collection. The conduct of these functions is increasingly being supported by modern technology systems.

This special feature is based on Chapter VI of *Comparative Analysis of Tax Administration in Asia and the Pacific 2018 Edition* ADB (2018_[1]). It provides a summary of recommended and observed features of key aspects of revenue body operations, including the use of electronic services.¹

Figure 2.1. Functions of tax administration

Source: Based on ADB 2018.

2.1. Registration and taxpayer identification

The identification and registration of taxpayers, both individuals and entities, are fundamental to a revenue body's system of managing all aspects of taxpayers' tax affairs. The systematic recording of taxpayers' identifying and updating of details, and the allocation of a unique high-integrity taxpayer identifier enable the efficient conduct of all downstream administration processes.

Good practices in taxpayer registration and identification are often associated with a number of features including (i) the use of a taxpayer identification number, ideally all numeric and with a check digit, which enables routine and systematic identification of taxpayers for all administrative actions, (ii) the availability and operation of an information technology system which support all aspects of registration and identification, and related administrative processes, (iii) the establishment of risk assessment processes which ensures that non-authentic applications for registration as a taxpayer are detected and actioned upon as needed, (iv) maintenance of a database of sufficient, accurate, and reliable identifying information (e.g. name, address, contact details, nature of business activity, and tax obligations by tax type), (v) the establishment and operation of processes which identify and flag dormant registrations (e.g. taxpayers temporarily residing in other countries), and keep the database clean of inactive (i.e. deceased persons and defunct businesses), invalid, and duplicate records.

With minor exception, all revenue bodies² reported the use of a taxpayer identification number (TIN) for their main taxes. However, some revenue bodies (e.g. China, Singapore and Thailand) reported that issuance of the TIN for some or all the main taxes is the responsibility of another body. This suggests that the TIN has other uses, for example, as a national identification number or business registration number, and is not primarily in place for tax administration purposes.

For the case of identifying large taxpayers such as big business entities or high profile individuals, the majority of Asia-Pacific's revenue bodies has implemented a specific unit or a sub-division within their tax administration. Some examples of this unit could be found in Myanmar with its Large Taxpayers Unit (LTU) introduced in 2015 and in Papua New Guinea with its Large Taxpayer Office (LTO). However, until 2018, absence of the unit can still be found in some economies such as Brunei Darussalam; Hong Kong, China; and Korea.

In general, various criteria such as economic sector, number of employees, turnover level, assets, capital invested and tax paid are used by the unit as measure of identification. The Malaysian LTU, which is nationally referred to as Large Taxpayer Branch (LTB), uses turnover level as its main criteria. Meanwhile, the LTU within the Philippines' Bureau of Internal Revenue (BIR) uses the size of collected tax as its identification criterion. Three sectors that mainly contribute to the BIR's LTU are banks, tobacco, and wholesale and retail stores. In some countries, LTUs provide services with largely a full range of functions such as end-to-end processing of taxpayers' affairs (as seen in Bangladesh, Mongolia, and New Zealand) to setups where the LTU provides only service and audit functions.

In addition to the routine identification of taxpayers, the taxpayer registration database provides valuable information for the conduct of compliance-checking programmes. For these and other administrative processes, ensuring the quality (i.e. accuracy and currency) of taxpayer identity and location details is necessary.

2.2. Taxpayer services

To achieve high levels of voluntary compliance, it is crucial that revenue bodies provide a comprehensive, well-targeted, and accessible range of services for taxpayers, their representatives, and other intermediaries that have a role to play in tax administration. Tax laws are inevitably complex, and citizens and business owners are often unfamiliar with the technical jargon of tax-related topics as well as changes in tax policy and administrative requirements that impose new and, at times, onerous obligations.

Good practices in taxpayer service delivery often include (i) providing taxpayers with information through a variety of user-friendly products and public education programmes, (ii) customising information to meet the specific needs of particular taxpayer segments, and tax intermediaries such as tax professionals regularly update products to reflect changes in the law and administrative procedures, (iii) delivering cost-effective services through means that are convenient to taxpayers, (iv) issuing binding tax rulings (public and private) to provide taxpayers with certainty as to how the tax administration will apply the tax law to particular transactions, (v) committing to service delivery standards and publicly account for the results achieved, (vi) monitoring frequently asked questions and common misunderstandings of the law detected through service and verification activities, and ensure remedial actions are taken, (vii) monitoring perceptions of service quality and administrative performance, and seek feedback on products and services from taxpayers and important intermediaries (e.g. tax professionals).

Reducing taxpayers' compliance burden and improving their satisfaction with the services delivered, improving certainty for taxpayers, and reducing operational costs are some of the objectives of having a formal strategy for improving service delivery in many revenue bodies. Service delivery standards are publicly available in a large majority of revenue bodies. The Client Charter of the Inland Revenue Board of Malaysia, for example, is publicly available, mentioning the standard of the delivery of each service, along with its monthly achievement status. The Inland Revenue Department of Hong Kong, China also has a taxpayers' charter, setting out the standards for 25 specific types of services. They publish the results of achievement in an annual report.

A system of public rulings that are binding is available in all revenue bodies, some revenue bodies also provide access to non-binding private rulings. Most revenue bodies provide both public and private rulings, and in the vast majority of cases, where rulings are issued, they are binding on the revenue body. Bangladesh, China, Fiji, Mongolia, Myanmar and Uzbekistan report that they do not currently issue public or private rulings, but Fiji advised that a framework is being developed. Only Tajikistan and Thailand issue non-binding rulings.

Electronic services such as information on websites, online transactions, and tools and calculators are commonly offered, while other services including integrated taxpayer accounts and electronic invoices (VAT) for businesses are less frequently offered. In China, the use of information system has been implemented through an individual income tax (IIT) withholding App. This aims to facilitate the filing of tax for taxpayers. Further improvement will be made to facilitate settlement by using payment platforms (PwC, 2019^[2]).

Tax professionals play a significant role in the operation of the tax system in many economies, and most revenue bodies report that there are laws that regulate activities of tax professionals. Many revenue bodies offer services to support tax professionals such as (i) the provision of regular updates on legislative and administrative changes; (ii) specific contact points (e.g. client or relationship managers); (iii) a dedicated section on the revenue body's

website; and (iv) online access for authorised agents to clients' tax data. Revenue bodies in Australia, Brunei Darussalam and Malaysia appear to have the most comprehensive suite of service offerings for tax agents. In each of these economies, tax agents are legally obliged to register with the revenue body.

2.3. Tax return and tax payment processing

Tax returns and payments constitute the most basic and important elements of data that taxpayers are required to provide to revenue bodies. Guidance for achieving effective and efficient tax return and payment processes typically draws attention to a range of desirable strategies and approaches, including providing a legislative framework for taxpayers' filing and payment obligations that balances the competing demands of key stakeholders (i.e. government revenue goals, revenue body workloads considerations, and taxpayers' compliance burden); designing tax returns that require the minimum level of data required from taxpayers to accurately calculate their tax liabilities, to properly assess the risk of incorrect reporting, and to satisfy other essential government requirements; providing easy-to-follow and accessible information products to assist taxpayers in meeting their return filing and payment obligations; prompting taxpayers on their immediate return filing and payment obligations; providing taxpayers with secure access to user-friendly systems for electronic filing of tax returns and electronic payment of taxes and actively promote their use; providing taxpayers with secure online access to their tax accounting records and other important items of personal taxpayer information.

Regarding the use of electronic filing of tax returns, considerable progress has been made for major taxes by a number of developing and emerging economies, such as India, Kazakhstan, Malaysia and Singapore). Since 2017, Sri Lanka has been putting into practice the electronic filing of tax returns through an automated system called Revenue Administration and Management Information System (RAMIS) (PwC/World Bank, 2018^[3]). Recently, data centre maintenance has been done several times by the Sri Lanka Inland Revenue in order to improve the system's performance. The New Zealand Inland Revenue also implemented an automatic tax system for the first time in April 2019. The system allows New Zealanders to get their tax assessment online which includes refunds and bills to pay (IRD, 2019^[4]). However, for quite a few other developing economies (e.g. Cambodia, Indonesia, Kyrgyzstan, Papua New Guinea and the Philippines), little progress has been made or these services are yet to be offered.

2.4. Verification activities

Revenue bodies typically carry out a large variety of activities to verify taxpayers' compliance with the laws. The primary verification activity undertaken by revenue bodies is usually called a "tax audit" or "tax control". Across revenue bodies, audit activities vary in their scope and intensity, and indeed in the precise nature of actions taken by officials that are deemed to constitute an audit. Revenue bodies also carry out various other activities, including in-depth fraud investigations, income-and-document matching checks, phone inquiries, computer-based audit and mathematical checks, and inspections of books and records that can result in changes to taxpayers' reported liabilities.

In Indonesia, for example, the Directorate General of Taxes (DGT) has been implementing a policy regarding the law enforcement on tax audit in order to revitalise the audit process. One of the outcomes has been a list of priority targets for tax audit which consists of non-compliant taxpayers (Whitehead, 2019^[5]).

Verification activity could also be in the form of a voluntary disclosure mechanism, which is regularly applied to facilitate tax compliance by encouraging taxpayers to disclose their past non-compliance. Fulfilment of the past non-compliance usually passes through an incentive mechanism. This includes penalties reduction, interest cut, freedom from audit and prosecution burden, as well as tax evaders' publicity in the case of Cook Islands.

Malaysia's Inland Revenue Board (IRB) is currently implementing special voluntary disclosure programmes (SPVD) that offer a seven-month period of lower penalty rates ranging between 10% and 15%. These rates are much lower than the 80% to 300% penalty rates that will be applied after the SPVD period (Whitehead, 2019^[5]). The voluntary disclosure programme is being implemented in several economies of the region such as Afghanistan; Australia; Bhutan; Hong Kong, China; Indonesia; Japan; Korea; New Zealand; Singapore; and Thailand. Economic benefits from such programme are notably known in Australia and New Zealand.

A reduction or waiver in the primary tax liability of a taxpayer, which is generally complemented by other conditions and concessions, also constitutes a form of incentive for fulfilling the past non-compliance. This programme is usually referred to as tax amnesty and has already been put into practice in countries such as Indonesia, Fiji, Papua New Guinea and India. In the Philippines, a Tax Amnesty Act was signed by the President on 14 February 2019, leading into a tax amnesty programme which includes general tax amnesty, estate tax amnesty, and tax amnesty on delinquencies (KPMG, 2019^[6]).

Guidance for achieving effective verification programmes typically draws attention to a range of desirable strategies and approaches, including:³

- Designing and implementing a programme of verification activities with an objective to maximise its impact across the broader taxpayer population. Programmes of this kind, which aim to improve accurate reporting across the board, focus on the highest compliance risks.
- Supporting audit operations with (i) a robust and comprehensive automated case management system; (ii) centralised audit case selection using analytics to select the highest risk cases within a target population of taxpayers; (iii) computer-assisted audit tools that enable the extraction, analysis, and cross-checking of large volumes of data from taxpayers' accounting system; and (iv) a uniform set of administrative penalties across all taxes for inaccurate reporting and judicial penalties for tax offenses, such as falsification of tax records.
- Building capacity in systematic cross-checking of third party information (e.g. from banks, stock exchanges, and government agencies) with amounts reported in tax declarations.
- Adopting co-operative compliance approaches to manage risks of inaccurate reporting.
- Developing benchmark economic performance parameters for key industries, business activities, professions, and occupations to identify taxpayers who file out-of-pattern tax declarations.
- Monitoring the overall level of correct reporting through various methods; for example, (i) tax gap analysis, (ii) use of advanced analytics using large data sets to determine the likelihood of taxpayers making full and accurate disclosures of income, and (iii) surveys monitoring taxpayer attitudes toward the accurate reporting of income (IMF, 2015^[7]).

Taxpayer verification activities typically account for a major share of revenue body resources. Allocations to verification-related functions and processes often represent a substantial share of a revenue body's overall staff resources. For this reason, how these

resources are used and the contribution they make to revenue collections and improving taxpayers' compliance are key considerations for all revenue bodies.

2.5. Taxpayer disputes

When revenue bodies review taxpayers' returns and make adjustments to assessments raised, or provide rulings on specific issues as a result of taxpayers' requests, taxpayers should be entitled to a review if they disagree with the decisions made. For this reason, establishing a process for reviewing a revenue body's decisions before seeking recourse through a judicial procedure is generally expected to lead to more efficient dispute resolution, benefitting taxpayers, revenue bodies, and governments.

The IMF's Field Guide for its diagnostic tool provides a useful set of guidance on good practices in the administration of tax disputes. These include:⁴ establishing a dispute resolution mechanism that is simple, transparent, and graduated; and codifying the dispute resolution process in a general tax administration law that has uniform application across all the main taxes; publishing clear explanations of taxpayers' rights and legal avenues for review of decisions made by the revenue body; ensuring that taxpayers receive clear explanations of adjustments made to tax liabilities following an audit, the reasons for any penalties, and their rights and avenues of review; having processes in place to ensure that the main reasons for successful taxpayer disputes are identified and remedial actions taken; allowing taxpayers to escalate a dispute directly to the second stage where the revenue body fails to complete an administrative review within a reasonable time frame; allowing suspension of collection of all or some of the disputed amount for the duration of the appeal process, if recovery of the debt is not considered to be at risk; making prompt refunds of overpaid tax where a dispute is resolved in the taxpayer's favour; making public the conditions under which the revenue body may reach an out-of-court settlement in respect of a tax dispute; having an effective and efficient case management system within the revenue body (IMF, 2015^[7]).

An administrative review is generally compulsory in all surveyed economies before a taxpayer can seek legal recourse. For example, the Australian Taxation Office (ATO) can pay a discretionary compensation regarding small business tax disputes. This programme is part of the Compensation for Detriment Caused by Defective Administration (or the CDDA Scheme), which implementation within the ATO is currently under review to ensure its improvement (Australia Government, 2019^[8]). However, there were exceptions where such reviews are not carried out by the revenue body, such as in the PRC. Some revenue bodies report that disputes can be resolved on a "risk basis". In some revenue bodies, disputed tax can be collected where a case is under administrative or court review. The main judicial forums used to resolve disputes are specialised tax courts, civil commercial courts, and criminal courts.

2.6. Collection of tax payments, including enforced debt collection

Tax laws typically prescribe the due date(s) and basis of computation for taxes to be paid, and it is generally the responsibility of revenue bodies to specify the precise payment requirements: (i) when to pay, (ii) who should pay, and (iii) the methods available for making payments. To encourage the payment of taxes on time, tax laws also generally provide an interest sanction for late payment and, in some cases, a penalty. Given the importance of meeting government revenue targets, revenue bodies must also have effective processes for ensuring timely follow-up action for overdue tax payments.

The features of tax system design and administration that contribute to high levels of effectiveness in collecting taxes on time and their enforcement where liabilities become overdue are specifically addressed in the IMF's diagnostic tool (TADAT) (IMF, 2015^[7]) and in other publications of international bodies.

Good practices in the collection of tax debts include:⁵ (i) aiming for optimal use of tax withholding at source and advance payment regimes. For advance payments, ensure that taxpayers can readily determine the amounts that they are expected to pay and provide advance notice of payment due dates, (ii) promoting the use of electronic payment methods, (iii) providing an appropriate legal framework, including comprehensive debt recovery powers and suitable late payment penalties and interests that are common across the main taxes, (iv) establishing dedicated debt collection enforcement units with full-time specialist staff; make use of outbound call centers and other communication facilities to contact debtors during and outside regular business hours, (v) managing the arrears inventory by reference to value, age, and collectability of cases; give priority attention to newer debts, noting that recovery rates on older tax arrears tend to decline over time, (vi) ensuring prompt write-off of established uncollectible arrears, and (vii) having an efficient and effective system of case management (IMF, 2015^[7]).

Other practices also existed in form of withholding at source and voluntary disclosure mechanism. Within the tax withholding at source method, intermediary bodies such as employers and financial institutions are involved. They are imposed to withhold tax from the payment of income so that taxpayers could fulfil their tax obligation on time. For example in Viet Nam, employees' income taxes are withheld by employers and are deposited before the 20th of the following month. On the other hand, Hong Kong, China and Singapore are not implementing this method, thus employers have to make advance payments and file returns.

In addition to the employment income, tax withholding at source also applied for other categories of personal income such as dividends, interest, rents, royalties and patents, share sales and purchases, and another income of resident and non-resident taxpayers. Tax withholding on other categories of income are reported by revenue bodies in Bangladesh, China, Indonesia, Kazakhstan, Mongolia, the Philippines and Thailand. Meanwhile, limited use of this method can be observed in Australia; Hong Kong, China; Malaysia; Maldives New Zealand and Singapore. Moreover, tax withholding can also be applied on specific income from several goods such as marine products and cocoa that are subjected to tax withholding by the Solomon Islands' revenue body.

Some of the most commonly used powers of revenue bodies for enforced debt collection were to grant taxpayers further time to pay, to make payment arrangements, to collect debts from third parties, to offset tax debts against tax credits or refunds, and to require taxpayers to obtain a tax clearance certificate before entering into government contracts. While the least frequently used or available powers were the ability to close a business or cancel a business license, denial of access to government services, imposition of liability on company directors, and publication of the names of debtors. A number of revenue bodies, including Brunei Darussalam; Cambodia; Hong Kong, China; Indonesia; Japan; Kazakhstan; Kyrgyzstan Maldives; Mongolia; New Zealand; China; Tajikistan and Thailand reported what appeared to be a more limited set of enforced debt collection powers.

Note: All units are in billions except for Cook Islands, Fiji, Papua New Guinea, Samoa, Solomon Islands, Tokelau and Vanuatu. Due to the size of their economies, the GDP figures for Cook Islands and Tokelau are expressed in thousands while they are in millions for Fiji, Papua New Guinea, Samoa, Solomon Islands and Vanuatu.

1. The year Y is calculated (at annual rate) as the average of: Q2(Y) to Q1(Y+1) for Japan; and Q3(Y) to Q2(Y+1) for Australia and New Zealand.
2. Data are reported on a fiscal year basis beginning 1st July. For example, the data for 2017 represent the period from July 2017 to June 2018. Data for 2017 are provisional.
3. The year Y is calculated using the formula $GDP(Y)/2+GDP(Y-1)/2$. This is done in order to make the value of the GDP correspond more closely to a July(Y-1)-to-June(Y) fiscal year.
4. The year Y is calculated using the formula $GDP(Y)*3/4+GDP(Y+1)/4$ in order to make it correspond more closely to an April(Y)-to-March(Y+1) fiscal year.

Country tables, tax revenues, 1997-2017

Chapter 4

Country tax revenue tables, 1997-2017

In all of the following tables a (“..”) indicates not available. The main series in this volume cover the years 1990 to 2017.

Figures referring to 1998-99, 2001-06, 2008-09 and 2011 in Tables 4.1 to 4.17 have been omitted because of lack of space. Full time series can be accessed at <https://stats.oecd.org/> within the theme Public Sector, Taxation and Market Regulation/Taxation/Revenue Statistics-Asian and Pacific Economies.

6200 Other

Note: Data are on a fiscal year basis beginning 1st July.

From 1998 taxes are recorded on an accrual basis; prior to that they were on a cash basis.

Direct taxes paid by public trading enterprises are excluded from receipts.

The figures for total tax revenue do not match the published totals in Taxation Revenue Australia. The latter is based on an accrual IMF GFS methodology and there are some differences between that and the OECD equivalent.

Heading 5213 includes radio and television licenses fees, though these are usually not regarded as a tax revenue in the OECD list.

Headings for non-wastable tax credits 1110 and 1210 include the private health insurance tax offset, family benefit, baby bonus tax offsets (paid during the 2003-04 budget year), film tax offset, and research and development tax offsets. The estimation of non-wastable credits into the expenditure and transfer components is in accordance with the OECD guidelines on the treatment and the data for this memorandum item has been provided by the Australian Taxation Office.

Note: Year ending 31st December.

The data are on a cash basis.

Figures exclude tax revenues collected by sub-national governments as the data are not available.

The resource tax and the tourist VAT refund registration fee (about 0.6% of GDP in 2017) are not included in tax revenues. These revenues are considered as non-tax revenue in accordance with the OECD classification, as set out in the Interpretative Guide in Annex A.

Table 4.5. Japan (cont.)
Details of tax revenue

Note: Data are on a fiscal year basis beginning 1st April.

From 1990, data are on accrual basis.

The figures for different groups of taxes are reported on different reporting bases, namely: Social security contributions (heading 2000) : in principle accrual basis, Central government taxes : accrual basis (revenues accrued during the fiscal year plus cash receipts collected before the end of May (the end of April until 1977), Local government taxes : accrual basis (due to be paid during the fiscal year and cash receipts collected before the end of May).

The Japanese authorities take the view that the Enterprise tax (classified in 1100 and 1200) and the Mineral product tax (classified in 5121) should be classified in heading 6000 since under articles 72 and 519 of the Local Tax Law these taxes are regarded as levies on the business or mining activity itself.

Heading 2000 includes some unidentifiable voluntary contributions.

Heading 2300: Includes contributions to the National pension, National Health Insurance and the Farmer's pension fund. Contributions to the Farmer's pension fund are not available for the years before 1999.

Heading 4100: Municipal property tax, includes Prefectural property tax from 1990 to 1994 because data is not available to provide a breakdown.

Heading 5121: Municipal tobacco tax, includes Prefectural tobacco tax from 1990 to 1994 because data is not available to provide a breakdown.

Heading 5121: In sub-item Petroleum and coal tax, the data before 2003 refer to petroleum tax.

Note: Year ending 31st December.

Data are on a cash basis.

The share of the Republic of Kazakhstan under production sharing contracts of oil companies, the bonuses of oil and non-oil sector companies, the levy for the use of the radio-frequency spectrum, the payment to compensate for historic costs as well as certain other items are classified as non-tax revenues according to the OECD Interpretative Guide, but are considered as tax revenues in Kazakhstan.

Headings 1210, 5124 and 5128: These categories include revenues that are paid to the National Fund of the Republic of Kazakhstan. This fund was created in 2000 as a stabilisation fund and includes revenues levied from oil and gas companies.

Heading 2000: Social security contribution revenues are not considered as tax revenues in Kazakhstan, but are considered as tax revenues under the OECD Interpretative Guide, subject to certain criteria.

Heading 4120: The uniform land tax is a presumptive tax for farmers and peasants' households. Such payers are not obliged to pay personal income tax, land tax, environmental fees, transport tax, property tax and other mandatory payments to the budget. The uniform land tax is levied on the value of land in use.

Note: Year ending 31st December.

Data are on cash basis.

Heading 2000: From 1997 the contributions to the three funds (civil servant pension fund, private school teachers pension fund and medical insurance fund) are classified as security social contributions. The reasons for the change are that the contributions either became mandatory or the fund started to be managed by public authorities in that year, thereby meeting the OECD definition of social security contributions.

Heading 2200: From 2007, this includes long-term care insurance.

Note: For the years before 1989 data are on a fiscal year basis ending 31st March. The figures provided for 1989 and onwards relate to the financial year ending 30th June of the following year.

From 1993, data are on accrual basis.

Heading 1000: Tax credits to exporters under the export incentives schemes are non-wastable, but that part of the excess of tax liability paid out to taxpayers is not identifiable.

Heading 1100: The figures up to 1969 include revenues collected by a social security income tax. The base of this tax was the same as the ordinary income tax base and the two have now been incorporated into a single income tax.

Heading 5121: From October 1986 incorporates that portion of the selective impost on wine, spirits, tobacco and motor vehicles which was formerly collected and reported as sales tax. The revenue collected on those imported goods which are subject to the equivalent of the domestic excise has been classified as excise duty. In this respect, there is a discontinuity between the excises recorded before and after October 1986.

Heading 5210: The other local authority licence fees include some small items which could be regarded as non-tax revenues.

Heading for non-wastable tax credits 1110 comprises four Family assistance tax credits. The total in item 1100 is net of the tax expenditure component but not net of the transfer component.

Note: Data are reported on a fiscal year basis beginning 1st July. For example, the data for 2017 represent the period from July 2017 to June 2018.

The data are on a cash basis.

Figures exclude tax revenues collected by sub-national governments as the data are not available.

The data from 2009 were provided on the basis of the IMF's GFSM 2014 classification. Prior to this year, data were provided on a different basis. The differences between the two sets of data are indicated below for the relevant tax revenue categories.

Heading 1000: Income tax revenues from 2009 onwards are net of income tax refunds. Prior to 2009, the income tax revenue figures are gross of refunds.

Heading 5111: VAGST revenues from 2009 onwards net of aid, loan payments by Treasury and VAGST paid by Government departments.

Heading 5123: Import duty from 2009 onwards is net of aid and loan payments by Treasury.

Heading 5126: Data from 2009 include revenues from fisheries' licences. Fisheries' licences revenues are usually classified as non-tax revenues according to the OECD classification set out in Annex A of the Interpretative Guide, but could not be distinguished from other revenues from taxes on specific services.

Note: Year ending 31st December.

The data are on a cash basis.

Figures exclude tax revenues collected by sub-national governments as the data are not available.

Some revenues (e.g. customs fees, penalties) amounting to SLB 1.03 million in 2017, representing 0.01% of GDP, are considered as non-tax revenues according to the OECD classification, described in the interpretative guide in Annex A. The national classification of Solomon Islands classifies these revenues as tax revenues.

Chapter 5

Country tables, non-tax revenues 2007-2017

Chapter 5

Non-tax revenue tables, 2007-2017

In all of the following tables a (“..”) indicates not available. The main series in this volume cover the years 2007 to 2017. Complete series are available on line at OECD (2019), “Revenue Statistics - Asian and Pacific Economies: Comparative tables”, OECD Tax statistics (database).

Table 5.1. Total non-tax revenue as percentage of GDP in selected Pacific economies, 2007-17

	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016	2017
Cook Islands	5.6	5.2	9.2	13.5	8.2	8.4	14.3	16.2	13.9	16.4	14.0

Note: Data are reported on a fiscal year basis beginning 1st July. For example, the data for 2017 represent the period from July 2017 to June 2018.

The data are on a cash basis.

Figures exclude non-tax revenues collected by sub-national governments as the data are not available.

The data from 2009 were provided on the basis of the IMF GFSM 2014 classification. Prior to this year, data were provided on a different basis. The differences between the two sets of data are indicated below for the relevant non-tax revenue categories.

Heading Grants: Data from 2009 includes only cash grants whereas data prior to that year also includes aid-funded projects.

Heading Sales of goods and services: Data from 2009 exclude fisheries' licences currently included in tax revenue under heading "5126 taxes on specific services" (more information can be found in Table 4.12). Fisheries' licences revenues are usually classified as non-tax revenues according to the the OECD classification set out in Annex A of the Interpretative Guide.

A.1. The OECD classification of taxes

1. 1000 Taxes on income, profits and capital gains
 - 1100 Taxes on income, profits and capital gains of individuals
 - 1110 On income and profits
 - 1120 On capital gains
 - 1200 Corporate taxes on income, profits and capital gains
 - 1210 On income and profits
 - 1220 On capital gains
 - 1300 Unallocable as between 1100 and 1200
2. 2000 Social security contributions
 - 2100 Employees
 - 2110 On a payroll basis
 - 2120 On an income tax basis
 - 2200 Employers
 - 2210 On a payroll basis
 - 2220 On an income tax basis
 - 2300 Self-employed or non-employed
 - 2310 On a payroll basis
 - 2320 On an income tax basis
 - 2400 Unallocable as between 2100, 2200 and 2300
 - 2410 On a payroll basis
 - 2420 On an income tax basis
3. 3000 Taxes on payroll and workforce
4. 4000 Taxes on property
 - 4100 Recurrent taxes on immovable property
 - 4110 Households
 - 4120 Other
 - 4200 Recurrent taxes on net wealth
 - 4210 Individual
 - 4220 Corporate
 - 4300 Estate, inheritance and gift taxes
 - 4310 Estate and inheritance taxes
 - 4320 Gift taxes
 - 4400 Taxes on financial and capital transactions
 - 4500 Other non-recurrent taxes on property
 - 4510 On net wealth
 - 4520 Other non-recurrent taxes
 - 4600 Other recurrent taxes on property

- 5. 5000 Taxes on goods and services
 - 5100 Taxes on production, sale, transfer, leasing and delivery of goods and rendering of services
 - 5110 General taxes
 - 5111 Value added taxes
 - 5112 Sales taxes
 - 5113 Other general taxes on goods and services
 - 5120 Taxes on specific goods and services
 - 5121 Excises
 - 5122 Paid by other than business or unidentifiable
 - 5123 Paid by other than business or unidentifiable
 - 5124 Paid by other than business or unidentifiable
 - 5125 Taxes on investment goods
 - 5126 Taxes on specific services
 - 5127 Other taxes on international trade and transactions
 - 5128 Other taxes on specific goods and services
 - 5130 Unallocable as between 5110 and 5120
 - 5200 Taxes on use of goods, or on permission to use goods or perform activities
 - 5210 Recurrent taxes
 - 5211 Paid by households in respect of motor vehicles
 - 5212 Paid by others in respect of motor vehicles
 - 5213 Other recurrent taxes
 - 5220 Non-recurrent taxes
 - 5300 Unallocable as between 5100 and 5200
- 6. 6000 Other taxes
 - 6100 Paid solely by business
 - 6200 Paid by other than business or unidentifiable

A.2. Coverage

General criteria

1. In the OECD classification the term “taxes” is confined to compulsory unrequited payments to general government. Taxes are unrequited in the sense that benefits provided by government to taxpayers are not normally in proportion to their payments.
2. The term “tax” does not include fines, penalties and compulsory loans paid to government. Borderline cases between tax and non-tax revenues in relation to certain fees and charges are discussed in §11–14.
3. General government consists of the central administration, agencies whose operations are under its effective control, state and local governments and their administrations, certain social security schemes and autonomous governmental entities, excluding public enterprises. This definition of government follows that of the 2008 *System of National Accounts (SNA)*.² In that publication, the general government sector and its sub-sectors are defined in Chapter 4, paragraphs 4.117 to 4.165.
4. Extra-budgetary units are part of the general government system. These are general government entities with individual budgets that are not fully covered by the main or general budget. These entities operate under the authority or control of a central, state, or local government. Extra-budgetary entities may have their own revenue sources, which may be supplemented by grants (transfers) from the general budget or from other sources. Even though their budgets may be subject to approval by the legislature, similar to that of budgetary accounts, they have discretion over the volume and composition of their spending. Such entities may be established to carry out specific government functions, such as road construction, or the nonmarket production of health or education services. Budgetary arrangements vary widely across countries, and various terms are used to describe these entities, but they are often referred to as “extra-budgetary funds” or “decentralised agencies”.
5. Compulsory payments to supra-national bodies and their agencies are no longer included as taxes as from 1998, with some exceptions. However, custom duties collected by EU member states on behalf of the European Union are still identified as memorandum items and included in overall tax revenue amounts in the country tables of the country in which they are collected (See §99). In countries where the church forms part of general government church taxes are included, provided they meet the criteria set out in §1 above. As the data refer to receipts of general government, levies paid to non-government bodies, welfare agencies or social insurance schemes outside general government, trade unions or trade associations, even where such levies are compulsory, are excluded. Compulsory payments to general government earmarked for such bodies are, however, included, provided that the government is not simply acting in an agency capacity.³ Profits from fiscal monopolies are distinguished from those of other public enterprises and are treated as taxes because they reflect the exercise of the taxing power of the state by the use of monopoly powers (see §65–67), as are profits received by the government from the purchase and sale of foreign exchange at different rates (see §74).
6. Taxes paid by governments (e.g., social security contributions and payroll taxes paid by governments in their capacity as an employer, consumption taxes on their purchases or taxes on their property) are not excluded from the data provided. However, where it is possible to identify the amounts of revenue involved,⁴ they are shown in Chapter 4.2 of this Report.

7. The relationship between this classification and that of the System of National Accounts (SNA) is set out in Sections A.9 and A.11 below. Because of the differences between the two classifications, the data shown in national accounts are sometimes calculated or classified differently from the practice set out in this guide. These and other differences are mentioned where appropriate (e.g., in §30 below) but it is not possible to refer to all of them. There may also be some differences between this classification and that employed domestically by certain national administrations (e.g., see §12 below), so that OECD and national statistics data may not always be consistent: any such differences, however, are likely to be very slight in terms of amounts of revenues involved.

Social security contributions

8. Compulsory social security contributions, as defined in §39, and paid to general government, are treated here as tax revenues. Being compulsory payments to general government they clearly resemble taxes. They may, however, differ from other taxes in that the receipt of social security benefits depends, in most countries, upon appropriate contributions having been made, although the size of the benefits is not necessarily related to the amount of the contributions. Better comparability between countries is obtained by treating social security contributions as taxes, but they are listed under a separate heading so that they can be distinguished in any analysis.

9. The strict dividing line between tax revenues (compulsory unrequited payments to general government) and non-tax compulsory payments (NTCPs) (payments that are either required or made to other institutions) is clearly defined. However, within the range of different compulsory payments to governments existing across countries, it is not always straightforward in practice to decide whether specific payments are either taxes or NTCPs. For example, compulsory pension savings that are controlled by general government and that accumulate on an individual account earning a market return or a rate that compensates for inflation would at first sight be categorised as NTCPs as opposed to taxes. However, even these payments might still be “unrequited” and therefore classify as taxes instead of NTCPs (for example if these pension savings are not paid out when the taxpayer dies before reaching the pension age and the funds are then used to provide a minimum pension to all taxpayers that are insured). These issues result in the social security revenue figures reported for most countries being based on the premise that all types of compulsory payments to general government are judged to some extent to have a re-distributional element. It should be noted that this conclusion is based on a typically broad interpretation of the term “unrequited” in the tax definition.

10. Social security contributions which are either voluntary or not payable to general government (see §1) are not treated as taxes, though in some countries, as indicated in the country footnotes, there are difficulties in completely eliminating voluntary contributions and certain compulsory payments to the private sector from the revenue figures. Imputed social security contributions are also not treated as taxes.

Fees, user charges and licence fees

11. Apart from vehicle licence fees, which are universally regarded as taxes, it is not easy to distinguish between those fees and user charges which are to be treated as taxes and those which are not, since, whilst a fee or charge is levied in connection with a specific service or activity, the strength of the link between the fee and the service provided may vary considerably, as may the relation between the amount of the fee and the cost of

providing the service. Where the recipient of a service pays a fee clearly related to the cost of providing the service, the levy may be regarded as required and under the definition of §1 would not be considered as a tax. In the following cases, however, a levy could be considered as “unrequired”:

- a) where the charge greatly exceeds the cost of providing the service;
- b) where the payer of the levy is not the receiver of the benefit (e.g., a fee collected from slaughterhouses to finance a service which is provided to farmers);
- c) where government is not providing a specific service in return for the levy which it receives even though a licence may be issued to the payer (e.g., where the government grants a hunting, fishing or shooting licence which is not accompanied by the right to use a specific area of government land);
- d) where benefits are received only by those paying the levy but the benefits received by each individual are not necessarily in proportion to her/his payments (e.g., a milk marketing levy paid by dairy farmers and used to promote the consumption of milk).

12. In marginal cases, however, the application of the criteria set out in §1 can be particularly difficult. The solution adopted – given the desirability of international uniformity and the relatively small amounts of revenue usually involved – is to follow the predominant practice among tax administrations rather than to allow each country to adopt its own view as to whether such levies are regarded as taxes or as non-tax revenue.⁵

13. A list of the main fees and charges in question and their normal⁶ treatment in this publication is as follows:

- *Non-tax revenues*: court fees; driving licence fees; harbour fees; passport fees; radio and television licence fees where public authorities provide the service.
- *Taxes within heading 5200*: permission to perform such activities as distributing films; hunting, fishing and shooting; providing entertainment or gambling facilities; selling alcohol or tobacco; permission to own dogs or to use or own motor vehicles or guns; severance taxes.

14. In practice it may not always be possible to isolate tax receipts from non-tax revenue receipts when they are recorded together. If it is estimated that the bulk of the receipts derive from non-tax revenues, the whole amount involved is treated as a non-tax revenue; otherwise, such government receipts are included and classified according to the rules provided in §32 below.

Royalties

15. The ownership of subsoil assets in the form of deposits of minerals or fossil fuels (coal, oil, or natural gas) depends upon the way in which property rights are defined by law and also on international agreements in the case of deposits below international waters. In some cases, either the ground below which the mineral deposits are located, the deposits themselves or both may belong to a local or central government unit.

16. In such cases, these general government units may grant leases to other institutional units that permit them to extract these deposits over a specified period of time in return for a payment or series of payments. These payments are often described as “royalties” but they are essentially rent that accrues to owners of natural resources in return for putting these assets at the disposal of other units for specified periods of time. The rent may take

the form of periodic payments of fixed amounts, irrespective of the rate of extraction, or, more commonly, they may be a function of the quantity, volume, or value of the asset extracted. Enterprises engaged in exploration on government land may make payments to general government units in exchange for the right to undertake test drilling or otherwise investigate the existence and location of subsoil assets. Such payments are also recorded as rents even though no extraction may take place. These payments are therefore classified as non-tax revenues.

17. The same principles apply when other institutional units are granted leases that permit them to fell timber in natural forests on land owned by general government units. These payments are also classified as non-tax revenues.

18. These rents or royalties paid to general government should not be confused with taxes on income and profits, severance taxes, business licenses, or other taxes. If the payments are levied on the profits from the extraction activity, then they should be classified as taxes on incomes, profits and gains (1000). In addition, any severance payments that are imposed on the extraction of minerals and fossil fuels from reserves owned privately or by another government should be classified as taxes. Payments related to the gross value of production should be classified as other taxes on goods and services (5128). Payments for a license or permit to conduct extraction operations should be classified as taxes on use of goods and on permission to use goods or perform activities (5213).

Fines and penalties

19. In principle, fines and penalties charged on overdue taxes or penalties imposed for the attempted evasion of taxes should not be recorded as tax revenues. However, it may not be possible to separate payments of fines or other penalties from the revenues from the taxes to which they relate. In this case the fines and penalties relating to a particular tax are recorded together with the revenues from that tax and fines and penalties paid with revenue from unidentifiable taxes are classified as other taxes in Category 6000. Fines not relating to tax offences (e.g., for parking offences), or not identifiable as relating to tax offences, are also not treated as tax revenues.

A.3. Basis of reporting

Accrual reporting

20. The data reported in this publication for recent years are predominantly recorded on an accrual basis, i.e. recorded at the time that the tax liability was created. Further information is provided in the footnotes to the country table in Chapter 4 of the Report.

21. However, data for earlier years are still predominantly recorded on a cash basis, i.e. at the time at which the payment was received by government. Thus, for example, taxes withheld by employers in one year but paid to the government in the following year and taxes due in one year but actually paid in the following year are both included in the receipts of the second year. Corrective transactions, such as refunds, repayments and drawbacks, are deducted from gross revenues of the period in which they are made.

22. Data on tax revenues are recorded without offsets for the administrative expenses connected with tax collection. Similarly, where the proceeds of tax are used to subsidise particular members of the community, the subsidy is not deducted from the yield of the tax, though the tax may be shown net of subsidies in the national records of some countries.

23. As regards fiscal monopolies (heading 5122), only the amount actually transferred to the government is included in government revenues. However, if any expenditures of fiscal monopolies are considered to be government expenditures (e.g., social expenditures undertaken by fiscal monopolies at the direction of the government) they are added back for the purpose of arriving at tax revenue figures (see §65 below).

The distinction between tax and expenditure provisions⁷

24. Because this publication is concerned only with the revenue side of government operations, no account being taken of the expenditure side, a distinction has to be made between tax and expenditure provisions. Normally there is no difficulty in making this distinction as expenditures are made outside the tax system and the tax accounts and under legislation separate from the tax legislation. In borderline cases, cash flow is used to distinguish between tax provisions and expenditure provisions. Insofar as a provision affects the flow of tax payments from the taxpayer to the government, it is regarded as a tax provision and is taken into account in the data shown in this publication. A provision which does not affect this flow is seen as an expenditure provision and is disregarded in the data recorded in this publication.

25. Tax allowances, exemptions and deductions against the tax base clearly affect the amount of tax paid to the government and are therefore considered as tax provisions. At the other extreme, those subsidies which cannot be offset against tax liability and which are clearly not connected with the assessment process, do not reduce tax revenues as recorded in this publication. Tax credits are amounts deductible from tax payable (as distinct from deductions from the tax base). Two types of tax credits are distinguished, those (referred to here as wastable tax credits) which are limited to the amount of the tax liability and therefore cannot give rise to a payment by the authorities to the taxpayer, and those (referred to as non-wastable tax credits) which are not so limited, so that the excess of the credit over the tax liability can be paid to the taxpayer.⁸ A wastable tax credit, like a tax allowance, clearly affects the amount of tax paid to the government, and is therefore considered as a tax provision. The practice followed for non-wastable tax credits⁹ is to distinguish between the “tax expenditure component”,¹⁰ which is that portion of the credit that is used to reduce or eliminate a taxpayer’s liability, and the “transfer component”, which is the portion that exceeds the taxpayer’s liability and is paid to that taxpayer. Reported tax revenues should be reduced by the amount of the tax expenditure component but not by the amount of the transfer component. In addition, the amounts of the tax expenditure and transfer components should be reported as memorandum items in the country tables. Countries that are unable to distinguish between the tax expenditure and transfer components should indicate whether or not the tax revenues have been reduced by the total of these components, and provide any available estimates of the amounts of the two components. Further information is given in Chapter 1 of the Report, which illustrates the effect of alternative treatments of non-wastable tax credits on tax to GDP.

Calendar and fiscal years

26. National authorities whose fiscal years do not correspond to the calendar year show data, where possible, on a calendar year basis to permit maximum comparability with the data of other countries. There remain a few countries where data refer to fiscal years. For these the GDP data used in the comparative tables also correspond to the fiscal years.

A.4. General classification criteria

The main classification criteria

27. The classification of receipts among the main headings (1000, 2000, 3000, 4000, 5000 and 6000) is generally governed by the base on which the tax is levied: 1000 income, profits and capital gains; 2000 and 3000 earnings, payroll or number of employees; 4000 property; 5000 goods and services; 6000 multiple bases, other bases or unidentifiable bases. Where a tax is calculated on more than one base, the receipts are, where possible, split among the various headings (see §32 and §81). The headings 4000 and 5000 cover not only taxes where the tax base is the property, goods or services themselves but also certain related taxes. Thus, taxes on the transfer of property are included in 4400¹¹ and taxes on the use of goods or on permission to perform activities in 5200. In headings 4000 and 5000 a distinction is made in certain sub-headings between recurrent and non-recurrent taxes: recurrent taxes are defined as those levied at regular intervals (usually annually) and non-recurrent taxes are levied once and for all (see also §47 to §50, §53, §54 and §79 for particular applications of this distinction).

28. Earmarking of a tax for specific purposes does not affect the classification of tax receipts. However, as explained in §39 on the classification of social security contributions, the conferment of an entitlement to social benefits is crucial to the definition of the 2000 main heading.

29. The way that a tax is levied or collected (e.g., by use of stamps) does not affect classification.

Classification of taxpayers

30. In certain sub-headings distinctions are made between different categories of taxpayers. These distinctions vary from tax to tax:

a) *Between individuals and corporations in relation to income and net wealth taxes*

The basic distinction is that corporation income taxes, as distinct from individual income taxes, are levied on the corporation as an entity, not on the individuals who own it, and without regard to the personal circumstances of these individuals. The same distinction applies to net wealth taxes on corporations and those on individuals. Taxes paid on the profits of partnerships and the income of institutions, such as life insurance or pension funds, are classified according to the same rule. They are classified as corporate taxes (1200) if they are charged on the partnership or institution as an entity without regard to the personal circumstances of the owners. Otherwise, they are treated as individual taxes (1100). Usually, there is different legislation for the corporation taxes and for the individual taxes.¹² The distinction made here between individuals and corporations does not follow the sector classification between households, enterprises, and so on of the System of National Accounts (SNA) for income and outlay accounts. The SNA classification requires certain unincorporated businesses¹³ to be excluded from the household sector and included with non-financial enterprises and financial institutions. The tax on the profits of these businesses, however, cannot always be separated from the tax on the other income of their owners, or can be separated only on an arbitrary basis. No attempt at this separation is made here and the whole of the individual income tax is shown together without regard to the nature of the income chargeable.

b) *Between households and others in relation to taxes on immovable property*

Here the distinction is that adopted by the SNA for the production and consumption expenditure accounts. The distinction is between households as consumers (i.e. excluding non-incorporated business) on the one hand and producers on the other hand. However, taxes on dwellings occupied by households, whether paid by owner-occupiers, tenants or landlords, are classified under households. This follows the common distinction made between taxes on domestic property versus taxes on business property. Some countries are not, however, in a position to make this distinction.

c) *Between households and others in relation to motor vehicle licences*

Here the distinction is between households as consumers on the one hand and producers on the other, as in the production and consumption expenditure accounts of the SNA.

d) *Between business and others in relation to the residual taxes (6000)*

The distinction is the same as in c) above between producers on the one hand and households as consumers on the other hand. Taxes which are included under the heading 6000 because they involve more than one tax base or because the tax base does not fall within any of the previous categories but which are identifiable as levyable only on producers and not on households are included under “business”. The rest of the taxes which are included under the heading 6000 are shown as “other” or non-identified.

Surcharges

31. Receipts from surcharges in respect of particular taxes are usually classified with the receipts from the relevant tax whether or not the surcharge is temporary. If, however, the surcharge has a characteristic which would render it classifiable in a different heading of the OECD list, receipts from the surcharge are classified under that heading separately from the relevant tax.

Unidentifiable tax receipts and residual sub-headings

32. A number of cases arise where taxes cannot be identified as belonging entirely to a heading or sub-heading of the OECD classification and the following practices are applied in such cases:

- a) The heading is known, but it is not known how receipts should be allocated between sub-headings: receipts are classified in the appropriate residual sub-heading (1300, 2400, 4520, 4600, 5130, 5300 or 6200).
- b) It is known that the bulk of receipts from a group of taxes (usually local taxes) is derived from taxes within a particular heading or sub-heading, but some of the taxes in the group whose amount cannot be precisely ascertained may be classifiable in other headings or sub-headings: receipts are shown in the heading or sub-heading under which most of the receipts fall.
- c) Either the heading nor sub-heading of a tax (usually local) can be identified: the tax is classified in 6200 unless it is known that it is a tax on business in which case it is classified in 6100.

A.5. Commentaries on items of the list

1000 — Taxes on income, profits and capital gains

33. This heading covers taxes levied on the net income or profits (i.e. gross income minus allowable tax reliefs) of individuals and enterprises. Also covered are taxes levied on the capital gains of individuals and enterprises, and gains from gambling.

34. Included in the heading are:

- a) taxes levied predominantly on income or profits, though partially on other bases. Taxes on various bases which are not predominantly income or profits are classified according to the principles laid down in §32 and §81;
- b) taxes on property, which are levied on a presumed or estimated income as part of an income tax (see also §47(a), (c) and (d));
- c) compulsory payments to social security fund contributions that are levied on income but do not confer an entitlement to social benefits. When such contributions do confer an entitlement to social benefits, they are included in heading 2000 (see §39);
- d) receipts from integrated scheduler income tax systems are classified as a whole in this heading, even though certain of the scheduler taxes may be based upon gross income and may not take into account the personal circumstances of the taxpayer.

35. The main subdivision of this heading is between levies on individuals (1100) and those on corporate enterprises (1200). Under each subdivision a distinction is made between taxes on income and profits (1110 and 1210), and taxes on capital gains (1120 and 1220). If certain receipts cannot be identified as appropriate to either 1100 or 1200, or if in practice this distinction cannot be made (e.g., because there are no reliable data on the recipients of payments from which withholding taxes are deducted) they are classified in 1300 as not-allocable.

Treatment of credits under imputation systems

36. Under imputation systems of corporate income tax, a company's shareholders are wholly or partly relieved of their liability to income tax on dividends paid by the company out of income or profits liable to corporate income tax. In countries with such systems,¹⁴ part of the tax on the company's profits is available to provide relief against the shareholders' own tax liability. The relief to the shareholder takes the form of a tax credit, the amount of which may be less than, equal to, or more than the shareholder's overall tax liability. If the tax credit exceeds this tax liability the excess may be payable to the shareholder. As this type of tax credit is an integral part of the imputation system of corporate income tax, any payment to the shareholders is treated as a repayment of tax and not as expenditure (compare the treatment of other tax credits described in §25).

37. As the tax credit under imputation systems (even when exceeding tax liability) is to be regarded as a tax provision, the question arises whether it should be deducted from individual income tax receipts (1110) or corporate income tax receipts (1210). In this Report, the full amount of corporate income tax paid is shown under 1210 and no imputed tax is included under 1110. Thus, the full amount of the credit reduces the amount of 1110 whether the credit results in a reduction of personal income tax liability or whether an actual refund is made because the credit exceeds the income tax liability. (Where, however, such tax credits are deducted from corporation tax in respect of dividends paid to corporations the amounts are deducted from the receipts of 1210.)

1120 and 1220 — Taxes on capital gains

38. These sub-headings comprise taxes imposed on capital gains, 1120 covering those levied on the gains of individuals and 1220 those levied on the gains of corporate enterprises, where receipts from such taxes can be separately identified. In many countries this is not the case and the receipts from such taxes are then classified with those from the income tax. Heading 1120 also includes taxes on gains from gambling.

2000 — Social security contributions

39. Classified here are all compulsory payments that confer an entitlement to receive a (contingent) future social benefit. Such payments are usually earmarked to finance social benefits and are often paid to institutions of general government that provide such benefits. However, such earmarking is not part of the definition of social security contributions and is not required for a tax to be classified here. However, conferment of an entitlement is required for a tax to be classified under this heading. So, levies on income or payroll that are earmarked for social security funds but do not confer an entitlement to benefit are excluded from this heading and shown under personal income taxes (1100) or taxes on payroll and workforce (3000). Taxes on other bases, such as goods and services, which are earmarked for social security benefits are not shown here but are classified according to their respective bases because they generally confer no entitlement to social security benefits.

40. Contributions for the following types of social security benefits would, *inter alia*, be included: unemployment insurance benefits and supplements, accident, injury and sickness benefits, old-age, disability and survivors' pensions, family allowances, reimbursements for medical and hospital expenses or provision of hospital or medical services. Contributions may be levied on both employees and employers.

41. Contributions may be based on earnings or payroll ("on a payroll basis") or on net income after deductions and exemptions for personal circumstances ("on an income tax basis"), and the revenues from the two bases should be separately identified if possible. However, where contributions to a general social security scheme are on a payroll basis, but the contributions of particular groups (such as the self-employed) cannot be assessed on this basis and net income is used as a proxy for gross earnings, the receipts may still be classified as being on a payroll basis. In principle, this heading excludes voluntary contributions paid to social security schemes. When separately identifiable these are shown in the memorandum item on the financing of social security benefits. In practice, however, they cannot always be separately identified from compulsory contributions, in which case they are included in this heading.

42. Contributions to social insurance schemes which are not institutions of general government and to other types of insurance schemes, provident funds, pension funds, friendly societies or other saving schemes are not considered as social security contributions. Provident funds are arrangements under which the contributions of each employee and of the corresponding employer on his/her behalf are kept in a separate account earning interest and withdrawable under specific circumstances. Pension funds are separately organised schemes negotiated between employees and employers and carry provisions for different contributions and benefits, sometimes more directly tied to salary levels and length of service than under social security schemes. When contributions to these schemes are compulsory or quasi-compulsory (e.g., by virtue of agreement with professional and union organisations) they are shown in the memorandum item (refer to Chapter 4.2 of the Report).

43. Contributions by government employees and by governments in respect of their employees, to social security schemes classified within general government are included in this heading. Contributions to separate schemes for government employees, which can be regarded as replacing general social security schemes, are also regarded as taxes.¹⁵ Where, however, a separate scheme is not seen as replacing a general scheme and has been negotiated between the government, in its role as an employer, and its employees, it is not regarded as social security and contributions to it are not regarded as taxes, even though the scheme may have been established by legislation.

44. This heading excludes “imputed” contributions, which correspond to social benefits paid directly by employers to their employees or former employees or to their representatives (e.g., when employers are legally obliged to pay sickness benefits for a certain period).

45. Contributions are divided into those of employees (2100), employers (2200), and self-employed or non-employed (2300), and then further sub-divided according to the basis on which they are levied. Employees are defined for this purpose as all persons engaged in activities of business units, government bodies, private non-profit institutions, or other paid employment, except the proprietors and their unpaid family members in the case of unincorporated businesses. Members of the armed forces are included, irrespective of the duration and type of their service, if they contribute to social security schemes. The contributions of employers are defined as their payments on account of their employees to social security schemes. Where employees or employers are required to continue the payment of social security contributions when the employee becomes unemployed these contributions, data permitting, are shown in 2100 and 2200 respectively. Accordingly, the sub-heading 2300 is confined to contributions paid by the self-employed and by those outside of the labour force (e.g., disabled or retired individuals).

3000 — Taxes on payroll and workforce

46. These consist of taxes payable by enterprises assessed either as a proportion of the wages or salaries paid or as a fixed amount per person employed. They do not include compulsory social security contributions paid by employers or any taxes paid by employees themselves out of their wages or salaries.

4000 — Taxes on property

47. This heading covers recurrent and non-recurrent taxes on the use, ownership or transfer of property. These include taxes on immovable property or net wealth, taxes on the change of ownership of property through inheritance or gift and taxes on financial and capital transactions. The following kinds of tax are excluded from this heading:

- a) taxes on capital gains resulting from the sale of a property (1120 or 1220);
- b) taxes on the use of goods or on permission to use goods or perform activities (5200); see §76;
- c) taxes on immovable property levied on the basis of a presumed net income which take into account the personal circumstances of the taxpayer. They are classified as income taxes along with taxes on income and capital gains derived from property (1100);
- d) taxes on the use of property for residence, where the tax is payable by either proprietor or tenant and the amount payable is a function of the user’s personal circumstances (pay, dependants, and so on). They are classified as taxes on income (1100);

- e) taxes on building in excess of permitted maximum density, taxes on the enlargement, construction or alteration of certain buildings beyond a permitted value and taxes on building construction. They are classified as taxes on permission to perform activities (5200);
- f) taxes on the use of one's own property for special trading purposes like selling alcohol, tobacco, meat or for exploitation of land resources (e.g., United States severance taxes). They are classified as taxes on permission to perform activities (5200).

4100 — Recurrent taxes on immovable property

48. This sub-heading covers taxes levied regularly in respect of the use or ownership of immovable property.

- these taxes are levied on land and buildings;
- they can be in the form of a percentage of an assessed property value based on a national rental income, sales price, or capitalised yield; or in terms of other characteristics of real property (for example size or location) from which a presumed rent or capital value can be derived;
- such taxes can be levied on proprietors, tenants, or both. They can also be paid by one level of government to another level of government in respect of property under the jurisdiction of the latter;
- debts are not taken into account in the assessment of these taxes, and they differ from taxes on net wealth in this respect.

49. Taxes on immovable property are further sub-divided into those paid by households (4110) and those paid by other entities (4120), according to the criteria set out in §30(b) above.

4200 — Recurrent taxes on net wealth

50. This sub-heading covers taxes levied regularly (in most cases annually) on net wealth, i.e. taxes on a wide range of movable and immovable property, net of debt. It is sub-divided into taxes paid by individuals (4210) and taxes paid by corporate enterprises (4220) according to the criteria set out in §30(a) above. If separate figures exist for receipts paid by institutions, the tax payments involved are added to those paid by corporations.

4300 — Estate, inheritance and gift taxes

51. This sub-heading is divided into taxes on estates and inheritances (4310) and taxes on gifts (4320).¹⁶ Estate taxes are charged on the amount of the total estate whereas inheritance taxes are charged on the shares of the individual recipients; in addition the latter may take into account the relationship of the individual recipients to the deceased.

4400 — Taxes on financial and capital transactions

52. This sub-heading comprises, *inter alia*, taxes on the issue, transfer, purchase and sale of securities, taxes on cheques, and taxes levied on specific legal transactions such as validation of contracts and the sale of immovable property. The heading does not include:

- a) taxes on the use of goods or property or permission to perform certain activities (5200);
- b) fees paid to cover court charges, charges for birth, marriage or death certificates, which are normally regarded as non-tax revenues (see §11);

- c) taxes on capital gains (1000);
- d) recurrent taxes on immovable property (4100);
- e) recurrent taxes on net wealth (4200);
- f) once-and-for-all levies on property or wealth (4500).

4500 — Other non-recurrent taxes on property

53. This sub-heading covers once-and-for-all, as distinct from recurrent, levies on property. It is divided into taxes on net wealth (4510) and other non-recurrent taxes on property (4520). Heading 4510 would include taxes levied to meet emergency expenditures, or for redistribution purposes. Heading 4520 would cover taxes levied to take account of increases in land value due to permission given to develop or provision of additional local facilities by general government, any taxes on the revaluation of capital and once-and-for-all taxes on particular items of property.

4600 — Other recurrent taxes on property

54. These rarely exist in OECD member countries, but the heading would include taxes on goods such as cattle, jewellery, windows, and other external signs of wealth.

5000 — Taxes on goods and services

55. All taxes and duties levied on the production, extraction, sale, transfer, leasing or delivery of goods, and the rendering of services (5100), or in respect of the use of goods or permission to use goods or to perform activities (5200) are included here. The heading thus covers:

- a) multi-stage cumulative taxes;
- b) general sales taxes – whether levied at manufacture/production, wholesale or retail level;
- c) value-added taxes;
- d) excises;
- e) taxes levied on the import and export of goods;
- f) taxes levied in respect of the use of goods and taxes on permission to use goods, or perform certain activities;
- g) taxes on the extraction, processing or production of minerals and other products.

56. Borderline cases between this heading and heading 4000 (taxes on property) and 6100 (other taxes on business) are referred to in §47, §52 and §78. Residual sub-headings (5300) and (5130) cover tax receipts which cannot be allocated between 5100 and 5200 and between 5110 and 5120, respectively; see §32.

5100 — Taxes on the production, sale, transfer, leasing and delivery of goods and rendering of services

57. This sub-heading consists of all taxes, levied on transactions in goods and services on the basis of their intrinsic characteristics (e.g., value, weight of tobacco, strength of alcohol, and so on) as distinct from taxes imposed on the use of goods, or permission to use goods or perform activities, which fall under 5200.

5110 — General taxes on goods and services

58. This sub-heading includes all taxes, other than import and export duties (5123 and 5124), levied on the production, leasing, transfer, delivery or sales of a wide range of goods and/or the rendering of a wide range of services, irrespective of whether they are domestically produced or imported and irrespective of the stage of production or distribution at which they are levied. It thus covers value-added taxes, sales taxes and multi-stage cumulative taxes. Receipts from border adjustments in respect of such taxes when goods are imported are added to gross receipts for this category, and repayments of such taxes when goods are exported are deducted. These taxes are subdivided into 5111 value-added taxes, 5112 sales taxes, 5113 turnover and other general taxes on goods and services.

59. Borderline cases arise between this heading and taxes on specific goods (5120) when taxes are levied on a large number of goods, for example, the United Kingdom purchase tax (repealed in 1973) and the Japanese commodity tax (repealed in 1988). In conformity with national views, the former United Kingdom purchase tax is classified as a general tax (5112) and the former Japanese commodity tax as excises (5121).

5111 — Value-added taxes

60. All general consumption taxes charged on value-added are classified in this sub-heading, irrespective of the method of deduction and the stages at which the taxes are levied. In practice, all OECD countries with value-added taxes normally allow immediate deduction of taxes on purchases by all but the final consumer and impose tax at all stages. In some countries the heading may include certain taxes, such as those on financial and insurance activities, either because receipts from them cannot be identified separately from those from the value-added tax, or because they are regarded as an integral part of the value-added tax, even though similar taxes in other countries might be classified elsewhere (e.g., 5126 as taxes on services or 4400 as taxes on financial and capital transactions).

5112 — Sales taxes

61. All general taxes levied at one stage only, whether at manufacturing or production, wholesale or retail stage are classified here.

5113 — Turnover and other general taxes on goods and services

62. These are multi-stage cumulative taxes and taxes where elements of consumption taxes are combined with multistage taxes. These taxes are levied each time a transaction takes place without deduction for taxes paid on inputs. Multi-stage taxes can be combined with elements of value-added or sales taxes.

5120 — Taxes on specific goods and services

63. Excises, profits generated and transferred from fiscal monopolies, and customs and imports duties as well as taxes on exports, foreign exchange transactions, investment goods and betting stakes and special taxes on services, which do not form part of a general tax of 5110, are included in this category.

5121 — Excises

64. Excises are taxes levied as a product specific unit tax on a predefined limited range of goods. Excises are usually levied at differentiated rates on nonessential or luxury goods, alcoholic beverages, tobacco, and energy. Excises may be imposed at any stage of production

or distribution and are usually assessed as a specific charge per unit based on characteristics by reference to the value, weight, strength, or quantity of the product. Included are special taxes on individual products such as sugar, sugar beets, matches, and chocolates; taxes levied at varying rates on a certain range of goods; and taxes levied on tobacco goods, alcoholic drinks, motor fuels, and hydrocarbon oils. If a tax collected principally on imported goods also applies, or would apply, under the same law to comparable domestically produced goods, then the revenue from this tax is classified as arising from excises rather than from import duties. This principle applies even if there is no comparable domestic production or no possibility of such production. Taxes on the use of utilities such as water, electricity, gas, and energy are regarded as excises rather than taxes on specific services (5126). Excises exclude those taxes that are levied as general taxes on goods and services (5110); profits of fiscal monopolies (5122); customs and other import duties (5123); or taxes on exports (5124).

5122 — Profits of fiscal monopolies

65. This sub-heading covers that part of the profits of fiscal monopolies which is transferred to general government or which is used to finance any expenditures considered to be government expenditures (see §23). Amounts are shown when they are transferred to general government or used to make expenditures considered to be government expenditures.

66. Fiscal monopolies reflect the exercise of the taxing power of government by the use of monopoly powers. Fiscal monopolies are non-financial public enterprises exercising a monopoly in most cases over the production or distribution of tobacco, alcoholic beverages, salt, matches, playing cards and petroleum or agricultural products (i.e. on the kind of products which are likely to be, alternatively or additionally, subject to the excises of 5121), to raise the government revenues which in other countries are gathered through taxes on dealings in such commodities by private business units. The government monopoly may be at the production stage or, as in the case of government-owned and controlled liquor stores, at the distribution stage.

67. Fiscal monopolies are distinguished from public utilities such as rail transport, electricity, post offices, and other communications, which may enjoy a monopoly or quasi-monopoly position but where the primary purpose is normally to provide basic services rather than to raise revenue for government. Transfers from such other public enterprises to the government are considered as non-tax revenues. The traditional concept of fiscal monopoly is not generally extended to include state lotteries, the profits of which are usually accordingly regarded as non-tax revenues. However, they can be included as tax revenues if the prime reason for their operation is to raise revenues to finance government expenditure. Fiscal monopoly profits are distinguished from export and import monopoly profits (5127) transferred from marketing boards or other enterprises dealing with international trade.

5123 — Customs and other import duties

68. Taxes, stamp duties and surcharges restricted by law to imported products are included here. Also included are levies on imported agricultural products which are imposed in member countries of the European Union and amounts paid by certain of these countries under the Monetary Compensation Accounts (MCA) system.¹⁷ Starting from 1998, customs duties collected by European Union member states on behalf of the European Union are no longer reported under this heading in the country tables (in Chapter 4 of the Report). Excluded here are taxes collected on imports as part of a general tax on goods and services, or an excise applicable to both imported and domestically produced goods.

5124 — Taxes on exports

69. In the 1970s, export duties were levied in Australia, Canada and Portugal as a regular measure and they have been used in Finland for counter-cyclical purposes. Some member countries of the European Union pay, as part of the MCA system, a levy on exports (see note 16 to §68). Where these amounts are identifiable, they are shown in this heading. This heading does not include repayments of general consumption taxes or excises or customs duties on exported goods, which should be deducted from the gross receipts under 5110, 5121 or 5123, as appropriate.

5125 — Taxes on investment goods

70. This sub-heading covers taxes on investment goods, such as machinery. These taxes may be imposed for a number of years or temporarily for counter-cyclical purposes. Taxes on industrial inputs which are also levied on consumers [e.g., the Swedish energy tax which is classified under (5121)] are not included here.

5126 — Taxes on specific services

71. All taxes assessed on the payment for specific services, such as taxes on insurance premiums, banking services, gambling and betting stakes (e.g., from horse races, football pools, lottery tickets), transport, entertainment, restaurant and advertising charges, fall into this category. Taxes levied on the gross income of companies providing the service (e.g., gross insurance premiums or gambling stakes received by the company) are also classified under this heading. Tax revenues from bank levies and payments to deposit insurance and financial stability schemes are provisionally included here for the 2012 edition. The detailed classification is set out in §108.

72. Excluded from this sub-heading are:

- a) taxes on services forming part of a general tax on goods and services (5110);
- b) taxes on electricity, gas and energy (5121 as excises);
- c) taxes on individual gains from gambling (1120 as taxes on capital gains of individuals and non-corporate enterprises) and lump-sum taxes on the transfer of private lotteries or on the permission to set up lotteries (5200);¹⁸
- d) taxes on cheques and on the issue, transfer or redemption of securities (4400 as taxes on financial and capital transactions).

5127 — Other taxes on international trade and transactions

73. This sub-heading covers revenue received by the government from the purchase and sale of foreign exchange at different rates. When the government exercises monopoly powers to extract a margin between the purchase and sales price of foreign exchange, other than to cover administrative costs, the revenue derived constitutes a compulsory levy exacted in indeterminate proportions from both purchaser and seller of foreign exchange. It is the common equivalent of an import duty and export duty levied in a single exchange rate system or of a tax on the sale or purchase of foreign exchange. Like the profits of fiscal monopolies and import or export monopolies transferred to government, it represents the exercise of monopoly powers for tax purposes and is included in tax revenues.

74. The sub-heading covers also the profits of export or import monopolies, which do not however exist in OECD countries, taxes on purchase or sale of foreign exchange, and any other taxes levied specifically on international trade or transactions.

5128 — Other taxes on specific goods and services

75. This item includes taxes on the extraction of minerals, fossil fuels and other exhaustible resources from deposits owned privately or by another government together with any other unidentifiable receipts from taxes on specific goods and services. Taxes on the extraction of exhaustible resources are usually a fixed amount per unit of quality or weight, but can be a percentage of value. The taxes are recorded when the resources are extracted. Payments from the extraction of exhaustible resources from deposits owned by the government unit receiving the payment are classified as rent.

5200 — Taxes on use of goods or on permission to use goods or perform activities

76. This sub-heading covers taxes which are levied in respect of the use of goods as distinct from taxes on the goods themselves. Unlike the latter taxes – reported under 5100 –, they are not assessed on the value of the goods but usually as fixed amounts. Taxes on permission to use goods or to perform activities are also included here, as are pollution taxes not based upon the value of particular goods. It is sometimes difficult to distinguish between compulsory user charges and licence fees which are regarded as taxes and those which are excluded as non-tax revenues. The criteria which are employed are noted in §11–12.

77. Although the sub-heading refers to the “use” of goods, registration of ownership rather than use may be what generates liability to tax, so that the taxes of this heading may apply to the ownership of animals or goods rather than their use (e.g., race horses, dogs and motor vehicles) and may apply even to unusable goods (e.g., unusable motor vehicles or guns).

78. Borderline cases arise with:

- a) taxes on the permission to perform business activities which are levied on a combined income, payroll or turnover base and, accordingly, are classified following the rules in §81;
- b) taxes on the ownership or use of property of headings 4100, 4200 and 4600. The heading 4100 is confined to taxes on the ownership or tenancy of immovable property and – unlike the taxes of 5200 – they are related to the value of the property. The net wealth taxes and taxes on chattels of 4200 and 4600 respectively are confined to the ownership rather than the use of assets, apply to groups of assets rather than particular goods and again are related to the value of the assets.

5210 — Recurrent taxes on use of goods and on permission to use goods or perform activities

79. The principal characteristic of taxes classified here is that they are levied at regular intervals and that they are usually fixed amounts. The most important item in terms of revenue receipts is vehicle licence taxes. This sub-heading also covers taxes on permission to hunt, shoot, fish or to sell certain products and taxes on the ownership of dogs and on the performance of certain services, provided that they meet the criteria set out in §11–12. The sub-divisions of 5210 are user taxes on motor vehicles paid by households (5211) and those paid by others (5212). Sub-heading 5213 covers dog licences and user charges for permission to perform activities such as selling meat or liquor when the levies are on a recurring basis. It also covers recurrent general licences for hunting, shooting and fishing where the right to carry out these activities is not granted as part of a normal commercial transaction (e.g., the granting of the licence is not accompanied by the right to use a specific area which is owned by government).

5220 — Non-recurrent taxes on use of goods and on permission to use goods or perform activities

80. This section covers non-recurrent taxes levied on the use of goods or on permission to use goods or perform activities and taxes levied each time goods are used. It includes taxes levied on the emission or discharge into the environment of noxious gases, liquids or other harmful substances:

- Payments for tradable emission permits issued by governments under cap and trade schemes should be recorded here at the time the emissions occur. No revenue should be recorded for permits that governments issue free of charge. The accrual basis of recording means that there can be a timing difference between the cash being received by government for the permits and the time the emission occurs. In the national accounts, this timing gives rise to a financial liability for government during the period.
- Payments made for the collection and disposal of waste or noxious substances by public authorities should be excluded as they constitute a sale of services to enterprises.

81. Other taxes falling under heading 5200 that are not levied recurrently are also included here. Thus, once-and-for-all payments for permission to sell liquor or tobacco or to set up betting shops are included provided they meet the criteria set out in §11–12.

6000 — Other taxes

82. Taxes levied on a base, or bases, other than those described under headings 1000, 3000, 4000 and 5000, or on bases of which cannot be considered to be related to any one of these headings, are included here. Where taxes are levied on a multiple base and it is possible to estimate the receipts related to each base the separate amounts are included under the appropriate headings. If separate amounts cannot be estimated and it is known that most of the receipts are derived from one base, the whole of the receipts are classified according to that base. Otherwise, they are classified here. Other revenues included here are presumptive taxes not included elsewhere in the classification system, taxes on individuals in the form of a poll tax or capitation tax, stamp taxes not related to financial and capital transactions nor falling exclusively on a single category of transaction, expenditure taxes where personal deductions or exemptions are applied and unidentifiable tax receipts. A subdivision is made between taxes levied wholly or predominantly on business (6100) and those levied on others (6200).

A.6. Conciliation with national accounts

83. This section of the tables provides a re-conciliation between the OECD calculation of total tax revenues and the total of all taxes and social contributions paid to general government as recorded in the country's national accounts. Where the country is a member of the European Union (EU), the comparison is between the OECD calculation of total tax revenues and the sum of tax revenues and social contributions recorded in the combination of the general government and the institutions of the EU sectors of the national accounts.

A.7. Memorandum item on the financing of social security benefits

84. In view of the varying relationship between taxation and social security contributions and the cases referred to in §39 to §45, a memorandum item collects together all payments earmarked for social security-type benefits, other than voluntary payments to the private sector. Data are presented as follows (refer to Chapter 4.2 of the Report):

- a) Taxes of 2000 series.
- b) Taxes earmarked for social security benefits.
- c) Voluntary contributions to the government.
- d) Compulsory contributions to the private sector.

Guidance on the breakdown of (a) to (d) above is provided in §39 to §45.

A.8. Memorandum item on identifiable taxes paid by government

85. Identifiable taxes actually paid by government are presented in a memorandum item classified by the main headings of the OECD classification of taxes. In the vast majority of countries, only social security contributions and payroll taxes paid by government can be identified. These are, however, usually the most important taxes paid by governments (refer to Chapter 4.2 of the Report).

A.9. Relation of OECD classification of taxes to national accounting systems

86. A system of national accounts (SNA) seeks to provide a coherent framework for recording and presenting the main flows relating respectively to production, consumption, accumulation and external transactions of a given economic area, usually a country or a major region within a country. Government revenues are an important part of the transactions recorded in SNA. The final version of the 2008 SNA was jointly published by five international organisations: the United Nations, the International Monetary Fund, the European Union, the Organisation for Economic Co-operation and Development, and the World Bank in August 2009. The System is a comprehensive, consistent and flexible set of macroeconomic accounts. It is designed for use in countries with market economies, whatever their stage of economic development, and also in countries in transition to market economies. The important parts of the SNA's conceptual framework and its definitions of the various sectors of the economy have been reflected in the OECD's classification of taxes.

87. There are, however, some differences between the OECD classification of taxes and SNA concepts that are listed below. They arise because the aim of the former is to provide the maximum disaggregation of statistical data on what are generally regarded as taxes by tax administrations:

- a) OECD includes compulsory social security contributions paid to general government in total tax revenues. Imputed and voluntary contributions plus those paid to private funds are not treated as taxes (§8 and §10 above);
- b) there are different points of view on whether or not some levies and fees are classified as taxes (§11 and §12 above);
- c) OECD excludes imputed taxes or subsidies resulting from the operation of official multiple exchange rates or from the central bank paying a rate of interest on required reserves that is different from other market rates;
- d) there are differences in the treatment of non-wastable tax credits.

88. As noted in §1 and §2, headings 1000 to 6000 of the OECD list of taxes cover all unrequited payments to general government, other than compulsory loans and fines. Such unrequited payments including fines, but excluding compulsory loans can be obtained from adding together the following figures in the 2008 SNA:

- value-added type taxes (D.211);
- taxes and duties on imports, excluding VAT (D.212);
- export taxes (D.213);
- taxes on products, excluding VAT, import and export taxes (D.214);
- other taxes on production (D.29);
- taxes on income (D.51);
- other current taxes (D.59);
- social contributions (D.61), excluding voluntary contributions;
- capital taxes (D.91).

A.10. The OECD classification of taxes and the International Monetary Fund (GFS) system

89. The coverage and valuation of tax revenues in the GFS system and the 2008 SNA are very similar. Therefore, the differences between the OECD classification and that of the 2008 SNA (see §87 above) also apply to the GFS. In addition the International Monetary Fund subdivides the OECD 5000 heading into section IV (Domestic Taxes on Goods and Services) and section V (Taxes on International Trade and Transactions). This reflects the fact that while the latter usually yield insignificant amounts of revenue in OECD countries, this is not the case in many non-OECD countries.

A.11. Comparison of the OECD classification of taxes with other international classifications

90. The table below describes an item by item comparison of the OECD classification of taxes and the classifications used in the following:

- a) System of National Accounts (2008 SNA);
- b) European System of Accounts (2010 ESA);
- c) IMF *Government Finance Statistics Manual* (GFSM 2014).

91. These comparisons represent those that would be expected to apply in the majority of cases. However in practice some flexibility should be used in their application. This is because in particular cases, countries can adopt varying approaches to the classification of revenues in national accounts.

OECD Classification	2008 SNA	2010 ESA	GFSM2014
1000 Taxes on income, profits and capital gains			
1100 Individuals			
1110 Income and profits	D51-8.61a	D51A	1111
1120 Capital gains	D51-8.61c, d	D51C, D	1111
1200 Corporations			
1210 Income and profits	D51-8.61b	D51B	1112
1220 Capital gains	D51-8.61c	D51C	1112
1300 Unallocable as between 1100 and 1200			1113

OECD Classification	2008 SNA	2010 ESA	GFSM2014
2000 Social security contributions			
2100 Employees	D613-8.85	D613	1211
2200 Employers	D611-8.83	D611	1212
2300 Self-employed, non-employed	D613-8.85	D613	1213
2400 Unallocable as between 2100, 2200 and 2300			1214
3000 Taxes on payroll and workforce	D29-7.97a	D29C	112
4000 Taxes on property			
4100 Recurrent taxes on immovable property			
4110 Households	D59-8.63a	D59A	1131
4120 Other	D29-7.97b	D29A	1131
4200 Recurrent net wealth taxes			
4210 Individual	D59-8.63b	D59A	1132
4220 Corporations	D59-8.63b	D59A	1132
4300 Estate, inheritance and gift taxes			
4310 Estate and inheritance taxes	D91-10.207b	D91A	1133
4320 Gift taxes	D91-10.207b	D91A	1133
4400 Taxes on financial and capital transactions	D59-7.96d; D29-7.97e	D214B, C	114114; 1161
4500 Other non-recurrent taxes on property	D91-10.207a	D91B	1135
4600 Other recurrent taxes on property	D59-8.63c	D59A	1136
5000 Taxes on goods and services			
5100 Taxes on production, sale and transfer of goods and services			
5110 General taxes on goods and services			
5111 Value-added taxes	D211-7.89	D211; D29G	11411
5112 Sales taxes	D2122-7.94a; D214-7.96a	D21224; D214I	11412
5113 Other general taxes on goods and services	D214-7.96a	D214I	11413
5120 Taxes on specific goods and services			
5121 Excises	D2122-7.94b; D214-7.96b	D21223; D214A, B, D	1142
5122 Profits of fiscal monopolies	D214-7.96e	D214J	1143
5123 Customs and other import duties	D2121-7.93	D2121; D21221, 2	1151
5124 On exports	D213-7.95a	D214K	1152-4
5125 On investment goods			
5126 On specific services	D2122-7.94c; D214-7.96c	D21225; D214E, F, G, H; D29F	1144; 1156
5127 Other taxes on international trade and transactions	D2122-7.94d D29-7.95b D29-7.97g D59-8.64d	D21226; D29D; D59E	1153; 1155-6
5128 Other taxes on specific goods and services			1146
5130 Unallocable between 5110 and 5120			
5200 Taxes on use of goods and on permission to use goods or perform activities			
5210 Recurrent taxes on use of goods and on permission to use goods or perform activities			
5211 Motor vehicle taxes households	D59-8.64c	D59D	11451
5212 Motor vehicles taxes others	D29-7.97d	D214D; D29B	11451
5213 Other recurrent taxes on use of goods and on permission to use goods or perform activities	D29-7.97c, d, f D59-8.64c	D29B, E, F; D59D	11452
5220 Non-recurrent taxes on permission to use goods or perform activities			11452
5300 Unallocable as between 5100 and 5200			
6000 Other taxes			
6100 Payable solely by business			1161
6200 Payable by other than business, or unidentifiable	D59-8.64a, b	D59B, C	1162

A.12. Attribution of tax revenues by sub-sectors of general government

92. The OECD classification requires a breakdown of tax revenues by sub-sectors of government. The definition of each sub-sector and the criteria to be used to attribute tax revenues between these sub-sectors are set out below. They follow the guidance of the 2008 SNA and GFSM 2014.

Sub-sectors of general government to be identified

a) Central government

93. The central government sub-sector includes all governmental departments, offices, establishments and other bodies which are agencies or instruments of the central authority whose competence extends over the whole territory, with the exception of the administration of social security funds. Central government therefore has the authority to impose taxes on all resident and non-resident units engaged in economic activities within the country.

b) State, provincial or regional government

94. This sub-sector consists of intermediate units of government exercising a competence at a level below that of central government. It includes all such units operating independently of central government in a part of a country's territory encompassing a number of smaller localities, with the exception of the administration of social security funds. In unitary countries, regional governments may be considered to have a separate existence where they have substantial autonomy to raise a significant proportion of their revenues from sources within their control and their officers are independent of external administrative control in the actual operation of the unit's activities.

95. At present, federal countries comprise the majority of cases where revenues attributed to intermediate units of government are identified separately. Spain is the only unitary country in this position. In the remaining unitary countries, regional revenues are included with those of local governments.

c) Local government

96. This sub-sector includes all other units of government exercising an independent competence in part of the territory of a country, with the exception of the administration of social security funds. It encompasses various urban and/or rural jurisdictions (e.g., local authorities, municipalities, cities, boroughs, districts).

d) Social security funds

97. Social security funds form a separate sub-sector of general government. The social security sub-sector is defined in the 2008 SNA by the following extracts from paragraphs 4.124 to 4.126 and 4.147:

“Social security schemes are social insurance schemes covering the community as a whole or large section of the community that are imposed and controlled by government units. The schemes cover a wide variety of programmes, providing benefits in cash or in kind for old age, invalidity or death, survivors, sickness and maternity, work injury, unemployment, family allowance, health care, etc. There is not necessarily a direct link between the amount of the contribution paid by an individual and the benefits he or she may receive.” (Paragraph 4.124).

“When social security schemes are separately organised from the other activities of government units and hold their assets and liabilities separately from the latter and engage in financial transactions on their own account they qualify as institutional units that are described as social security funds.” (Paragraph 4.125).

“The amounts raised, and paid out, in social security contributions and benefits may be deliberately varied in order to achieve objectives of government policy that have no direct connection with the concept of social security as a scheme to provide social benefits to members of the community. They may be raised or lowered in order to influence the level of aggregate demand in the economy, for example. Nevertheless, so long as they remain separately constituted funds, they must be treated as separate institutional units in the SNA. (Paragraph 4.126).

“The social security funds sub-sector (of general government) consists of the social security funds operating at all levels of government. Such funds are social insurance schemes covering the community as a whole or large section of the community that are imposed by government units.” (Paragraph 4.147).

98. This definition of social security funds is followed in the OECD classification with the two following exceptions which are excluded

- schemes imposed by government and operated by bodies outside the general government sector, as defined in §3 of this manual; and
- schemes to which all contributions are voluntary.

Supra-national authorities

99. This sub-sector covers the revenue-raising operations of supra-national authorities within a country. In practice, the only relevant supra-national authority in the OECD area is that of the institutions of the European Union (EU). As from 1998, supra-national authorities are no longer included in the *Revenue Statistics*, to achieve consistency with the SNA definition of general government which excludes them. For example, income taxes and social security contributions collected by European institutions and paid by European civil servants who are resident of EU member countries should not be included. However the specific levies paid by the member states of the EU continue to be included in total tax revenues and they are shown under this heading.

Criteria to be used for the attribution of tax revenues

100. When a government collects taxes and pays them over in whole or in part to other governments, it is necessary to determine whether the revenues should be considered to be those of the collecting government which it distributes to others as grants, or those of the beneficiary governments which the collecting government receives and passes on only as their agent. The criteria to be used in the attribution of revenues are set out in §101 to §104 which replicate paragraphs 3.70 to 3.73 from the 2008 SNA.

101. In general, a tax is attributed to the government unit that:

- a) exercises the authority to impose the tax (either as a principal or through the delegated authority of the principal);
- b) has final discretion to set and vary the rate of the tax.

102. Where an amount is collected by one government for and on behalf of another government, and the latter government has the authority to impose the tax, and set and vary its rate, then the former is acting as an agent for the latter and the tax is reassigned. Any amount retained by the collecting government as a collection charge should be treated as a payment for a service. Any other amount retained by the collecting government, such as under a tax-sharing arrangement, should be treated as a current grant. If the collecting government was delegated the authority to set and vary the rate, then the amount collected should be treated as tax revenue of this government.

103. Where different governments jointly and equally set the rate of a tax and jointly and equally decide on the distribution of the proceeds, with no individual government having ultimate overriding authority, then the tax revenues are attributed to each government according to its respective share of the proceeds. If an arrangement allows one government unit to exercise ultimate overriding authority, then all of the tax revenue is attributed to that unit.

104. There may also be the circumstance where a tax is imposed under the constitutional or other authority of one government, but other governments individually set the tax rate in their jurisdictions. The proceeds of the tax generated in each respective government's jurisdiction are attributed as tax revenues of that government.

Levies paid by member states of the European Union

105. The levies paid by the member states of the EU take the form of specific levies which include:

- a) custom duties and levies on agricultural goods (5123);
- b) gross monetary compensation accounts (5123 if relating to imports and 5124 if relating to exports); and
- c) steel, coal, sugar and milk levies (5128).

106. The custom duties collected by member states on behalf of the EU are recorded:

- on a gross of collection fee basis;
- using figures adjusted so that duties are shown on a “final destination” as opposed to a “country of first entry” basis where such adjustments can be made. These adjustments concern in particular duties collected at important (sea) ports. Although the EU duties are collected by the authorities of the country of first entry, when possible these duties should be excluded from the revenue of the collecting country and be included in the revenue of the country of final destination.

107. This is the specific EU levy that most clearly conforms to the attribution criterion described in §99 above. Consequently as from 1998, these amounts are footnoted as a memorandum item to EU member state country tables and no longer shown under heading 5123. However the figures are included in the total tax revenue figures on the top line for all the relevant years shown in the tables.

A.13. Provisional classification of revenues from bank levies and payments to deposit insurance and financial stability schemes

108. The OECD have adopted the following interim approach to reporting revenue from bank levies plus deposit insurance and stability fees for the 2012 and subsequent editions of *OECD Revenue Statistics*. It is recommended that the amounts should be recorded under category 5126:

- Compulsory payments of stability fees, bank levies and deposit insurance should generally be treated as tax revenues where the payments are made to general government and allocated to the governments' consolidated or general funds so that the government is free to make immediate use of the money for the purposes that it chooses. This principle would apply regardless of whether the government is promising to make payments to guarantee the banks' customer deposits in some future contingency.

- If the compulsory payments are made to general government and placed in funds that are earmarked to be entirely channelled back to the sector of the economy that comprises the companies that are subject to the payment, they would still generally be treated as tax revenues on the grounds that the funds would be available for the government and would reduce its budget deficit, the fee is unrequited for an individual entity and the amounts raised could be unrelated to any eventual pay out to depositors or expenditure on wider support for the financial sector.
- Payments made to the smaller long-standing schemes for insuring “retail” deposits, where the payment levels are consistent with the costs of insurance, should be classified as fee for service.
- Any payments which involve governments realising the assets of a failed institution or receiving a priority claim on its assets in liquidation in order to fund payments of compensation to customers for their lost deposits would be treated as a fee for a service as opposed to tax revenues.
- Compulsory payments that are made to funds operated outside the government sector and non-state institutions backed by the deposit takers and all payments to voluntary schemes should not be treated as tax revenues.

Notes

1. References in this OECD Interpretative Guide to sections or parts of “this Report” refer to OECD (2018), *Revenue Statistics 2018*, OECD Publishing, Paris.
2. All references to SNA are to the 2008 edition.
3. See section A.12 of this guide for a discussion of the concept of agency capacity.
4. It is usually possible to identify amounts of social security contributions and payroll taxes, but not other taxes paid by government.
5. If, however, a levy which is considered as non-tax revenue by most countries is regarded as a tax – or raises substantial revenue – in one or more countries, the amounts collected are footnoted at the end of the relevant country tables, even though the amounts are not included in total tax revenues.
6. Names, however, can frequently be misleading. For example, though a passport fee would normally be considered a non-tax revenue, if a supplementary levy on passports (as is the case in Portugal) were imposed in order to raise substantial amounts of revenue relative to the cost of providing the passport, the levy would be regarded as a tax under 5200.
7. A more detailed explanation of this distinction can be found in the special feature “Current issues in reporting tax revenues”, in the 2001 edition of the *Revenue Statistics*.
8. Sometimes the terms “non-refundable” and “refundable” are used, but it may be considered illogical to talk of “refundable” when nothing has been paid.
9. A different treatment, however, is accorded to non-wastable tax credits under imputation systems of corporate income tax (§36–38).
10. This is not strictly a true tax expenditure in the formal sense. Such tax expenditures require identification of a benchmark tax system for each country or, preferably, a common international benchmark. In practice it has not been possible to reach agreement on a common international benchmark.
11. Unless based on the profit made on a sale, in which case they would be classified as capital gains taxes under 1120 or 1220.
12. In some countries the same legislation applies to both individual and corporate enterprises for particular taxes on income. However, the receipts from such taxes are usually allocable between individuals and enterprises and can therefore be shown in the appropriate sub-heading.
13. For example, “...sufficiently self-contained and independent that they behave in the same way as corporations...(including) keeping a complete set of accounts” (2008 SNA, section 4.44).

14. In Canada – a country also referred to as having an imputation system – the (wastable) tax credit for the shareholder is in respect of domestic corporation tax deemed to have been paid whether or not a corporation tax liability has arisen. As there is no integral connection between the corporation tax liability and the credit given against income tax under such systems, these credits for dividends are treated, along with other tax credits, on the lines described in §25.
15. This may also apply where a scheme for government employees existed prior to the introduction of a general social security scheme.
16. In the 2008 SNA these are regarded as capital transfers and not as taxes (see Section A.8).
17. This is the system by which the European Union adjusts for differences between the exchange rates used to determine prices under the Common Market Agricultural Policy and actual exchange rates. Payments under the system may relate to imports or exports and where these amounts are separately identifiable they are shown under the appropriate heading (5123 or 5124). In this Report, these amounts are shown gross (i.e. without deducting any subsidies paid out under the MCA system).
18. Transfers of profits of State lotteries are regarded as non-tax revenues (see also §67).

B.7. Miscellaneous and unidentified revenue	134
Notes.....	134

B.1. Coverage

The definition of non-tax revenues and the main sub-categories identified in this publication generally correspond to the concepts laid out in the 2014 IMF Government Finance Statistics Manual (GFSM). Non-tax revenues refer to increases in government net worth resulting from transactions other than tax revenues. They exclude funds arising from the repayment of previous lending by governments or from borrowing, or proceeds derived from sales of fixed capital assets, stocks, land and intangible assets or private gifts.

Non-tax revenues are made up of the following elements.

B.2. Grants

The GFSM 2014 states “Grants are transfers receivable by government units from non-resident government units or international organisations without the receipt of any goods, services, or assets in return. Grants are normally receivable in cash, but may also take the form of the receipt of goods or services (in kind)”. These transfers are un-refundable and unrequited. Grants encompass reparations and gifts given for particular projects or programmes. The term “grants” is not used to refer to transfers to or from non-governmental units and excludes inter-governmental transfers. The remission of funds collected by one government for another in an agency capacity should not be shown as receipt of a grant by the beneficiary government but as its direct receipt of revenue.

B.3. Property income

This category includes income to government arising from their ownership of property, enterprises, financial assets, or intangible assets when government units place them at the disposal of other units. Sales of non-financial assets such as the sales of lands are not recorded as revenue because disposal of such an asset does not increase the net worth. Similarly, repayments on loans and loan disbursements are not revenue. Property income may take the form of dividends, interest, land rents, royalties, or withdrawals from entrepreneurial income. The main components are:

- **Interest and dividends:** Interest is the revenue earned by the government unit from a financial asset by putting it at the disposal of another institutional unit. Dividends are the revenue earned by placing equity funds at the disposal of a corporation (resident or non-resident corporation). This category also consists of profits of state-owned enterprises except those classified as fiscal monopolies (see §62-§64 of the OECD Interpretative Guide to tax revenue in Annex A), export and import monopoly profits (see §70-§71 of the same document) or those providing public utilities such as rail transport, electricity, post offices and other communications. In this category are included revenue from public financial institutions such as the central banks’ profits, profits transferred or distributed from the operation of monetary authority functions outside the central bank and the profits of state lotteries transferred to the government. Transfers from public utilities enterprises are recorded as non-tax revenue under “sales of goods and services” whereas profits for fiscal, export or import monopolies are classified as tax revenue.
- **Rents or royalties:** Rent is the revenue generated from natural resources, such as land, mining, or oil resources, when a government unit places these at the disposal of private or foreign entities. The rents received relate to a resource lease-giving agreement for the exploitation and extraction of a natural resource by the lessee in return for a payment. Payments for exploration rights are also treated as rent. Rents should not be confused

with other payments a government may receive related to the exploitation of subsoil and similar assets, such as severance taxes, business licenses, or other taxes (e.g. value added taxes, excises, taxes on exports, etc.). They should also not be taken to mean incomes from the rental of buildings and equipment, which are treated as sales of goods and services. Revenues from rents and royalties are in some cases difficult to establish and depend on the agreement between the government unit and the lessee. For example rents, royalties and taxes such as corporate income taxes and VAT are sometimes encompassed in a single payment to the general government. In such cases the revenue should be classified under the category to which the majority of revenue belongs (see §71 of Annex A for further explanation.)

- Other property income: This includes revenue earned by a government unit placing funds at a disposal of quasi-corporations.¹ Conceptually this source of revenue is equivalent to that of dividends from a corporation but by definition, quasi-corporations cannot distribute income in the form of dividends. This category of “other property income” also includes retained or reinvested earnings, i.e. the percentage of distributable revenue not paid out as dividends, but retained by the corporation or quasi-corporation on foreign investment; and property income from investment income disbursements and unidentified property income.

B.4. Sales of goods and services

Revenue under the category “sales of goods and services” is generally reported on a gross basis, without deduction of costs. Since these costs can represent a significant proportion of revenues, they cannot be regarded in total as funds available for governments to finance their general activities. This contrasts with tax revenues, where the collection costs are usually a small proportion of revenue. This difference implies that it may not be meaningful to sum tax and non-tax revenues as part of a calculation of generally available funds.

The proceeds of sales of non-financial assets such as the sale of buildings or lands are not classified as revenues since their disposal does not increase the net worth.

Sales of goods and services consist of:

- Sales by market establishments.²
- Administrative fees for services (i.e. fees for drivers’ licences, passports, visas, court fees, harbour fees, fees for birth, marriage or death certificates, patent registrations, radio and television licenses when public authorities provide general broadcasting services).
- Administrative fees that are sales of services associated with a regulatory function of government (such as fees for the inspection of premises before delivering a business licence) and considered to be proportional to the cost of producing the service are included in this category. If the fee in return for the service provided by the government unit is disproportionate, then the fee will be classified as a tax. Specific examples of fees that are considered taxes include fees for permission to perform activities such as hunting, fishing and shooting; and fees for business registration where this is a legal requirement for the business to operate.
- Sales by non-market establishments such as fees at government hospitals, tuition fees at government schools and admission fees to museums and parks.
- Leasing of buildings and equipment.

B.5. Fines, penalties and forfeits

The GFSM 2014 states “Fines and penalties are compulsory transfers imposed by courts of law or bodies for violations of laws or administrative rules. Out-of-court agreements are also included (...). Forfeits are amounts deposited with a general government unit pending a legal or administrative proceeding, and that will be transferred to the unit upon resolution”. For example traffic fines are included here. Fines and penalties charged on overdue taxes or penalties imposed for the evasion of taxes should be recorded in this category and not as taxes. However, if it is not possible to separate the amounts paid in taxes and fines, the whole amount should be classified under the tax to which the fine relates (see §14 of Annex A for further explanation).

B.6. Other social contributions

This category includes the actual and imputed contributions to social insurance schemes operated by governments as employers on behalf of their employees that do not create a future defined liability. This category also includes the sum of the total voluntary contributions.³ Excluded from this category are any contributions to funds in which the contributions of each participant and of her/his employer on her/his behalf are kept in a separate account earning interest and withdrawable under specified circumstances or any contributions to a pension fund autonomous to the general government. This category is not included in this publication.

B.7. Miscellaneous and unidentified revenue

This category consists of unidentified non-tax revenues or those that do not fit into any of the other categories listed above. It includes revenue such as gifts and transfers from individuals, private non-profit institutions, non-governmental foundations, corporations, or sources other than governments and international organisations. Major non-recurrent payments receivable in compensation for extensive damages or serious injuries not covered by insurance policies are also included, such as payments of compensation for damages caused by major explosions; oil spillages; or payments receivable for damage to property other than payments from an insurance settlement.

Notes

1. Quasi-corporations are unincorporated enterprises that exercise some functions of corporations, but have not been granted separate legal personality by statute.
2. A market establishment is an establishment that charges economically significant prices.
3. The IMF includes these contributions as part of their total of social security contributions.

ORGANISATION FOR ECONOMIC CO-OPERATION AND DEVELOPMENT

The OECD is a unique forum where governments work together to address the economic, social and environmental challenges of globalisation. The OECD is also at the forefront of efforts to understand and to help governments respond to new developments and concerns, such as corporate governance, the information economy and the challenges of an ageing population. The Organisation provides a setting where governments can compare policy experiences, seek answers to common problems, identify good practice and work to co-ordinate domestic and international policies.

The OECD member countries are: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Korea, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, the Slovak Republic, Slovenia, Spain, Sweden, Switzerland, Turkey, the United Kingdom and the United States. The European Union takes part in the work of the OECD.

OECD Publishing disseminates widely the results of the Organisation's statistics gathering and research on economic, social and environmental issues, as well as the conventions, guidelines and standards agreed by its members.

OECD DEVELOPMENT CENTRE

The OECD Development Centre was established in 1962 as an independent platform for knowledge sharing and policy dialogue between OECD member countries and developing economies, allowing these countries to interact on an equal footing. Today, 27 OECD countries and 30 non-OECD countries are members of the Centre. The Centre draws attention to emerging systemic issues likely to have an impact on global development and more specific development challenges faced by today's developing and emerging economies. It uses evidence-based analysis and strategic partnerships to help countries formulate innovative policy solutions to the global challenges of development.

For more information on the Centre and its members, please see www.oecd.org/dev.

Revenue Statistics in Asian and Pacific Economies

1990-2017

SPECIAL FEATURE: TAX ADMINISTRATION OPERATIONS

Revenue Statistics in Asian and Pacific Economies is jointly produced by the Organisation for Economic Co-operation and Development (OECD)'s Centre for Tax Policy and Administration (CTP) and the OECD Development Centre (DEV) with the co-operation of the Asian Development Bank (ADB), the Pacific Island Tax Administrators Association (PITAA), and the Pacific Community (SPC) and the financial support of the European Union and the government of Japan. It compiles comparable tax revenue statistics for Australia, Cook Islands, Fiji, Indonesia, Japan, Kazakhstan, Korea, Malaysia, New Zealand, Papua New Guinea, Philippines, Samoa, Singapore, Solomon Islands, Thailand, Tokelau and Vanuatu and comparable non-tax revenue statistics for the Cook Islands, Papua New Guinea, Samoa, Tokelau and Vanuatu. The model is the OECD Revenue Statistics database which is a fundamental reference, backed by a well-established methodology, for OECD member countries. Extending the OECD methodology to Asian and Pacific economies enables comparisons about tax levels and tax structures on a consistent basis, both among Asian and Pacific economies and with OECD, Latin American and Caribbean and African averages.
