

ICIO-TIVA HIGHLIGHTS: GVC INDICATORS FOR THE SLOVAK REPUBLIC

OECD's Inter-Country Input-Output (ICIO) tables have been supporting analysis of global and regional interdependencies for over 10 years. Notably, ICIO-based **Trade in Value Added (TiVA)** indicators offer new insights into the commercial relations among economies and provide a broad view of where value is created along **global value chains (GVCs)**. Compared to gross trade statistics, the TiVA approach better reflects the contribution to trade made by services, the role of imports in export performance, and the true nature of economic interdependencies through indicators based on the value-added origins (both country and industry) of exports, imports and final demand. ICIO tables are also used to generate indicators of **Trade in Employment (TiM)**, revealing the impact of GVCs on jobs, and **Greenhouse Gas Footprints**, providing insights into how final demand in a country drives emissions abroad. A further extension of the ICIO tables, the **Analytical AMNE** database examines the role of multinational enterprises in global production networks. The 2023 versions of these databases cover up to 76 economies and 45 industrial sectors, for the years 1995 to 2020. A new dataset introduces two novel indicators to assess the importance of direct and indirect gross output linkages along GVCs. This note highlights a selection of GVC-related indicators for **the Slovak Republic**, that can help inform analysis in a range of policy areas including environment, industry, innovation, investment and trade. A **glossary** is provided for further information on how these indicators can be harnessed for analysis.

Figure 1. Foreign value-added content of gross exports
As a percentage of total gross exports, 1995 to 2020

A standard way to evaluate globalisation through trade in intermediate inputs is to consider the foreign value-added content of gross exports. This reflects “backward participation” in GVCs. At the global level, the new TiVA indicators confirm that there has been a slowdown in GVC integration since the Financial Crisis in 2008-09 (Figure 1). In general, foreign value added in trade has remained relatively stable over the last decade.

Between 2008 and 2020, the foreign content of the Slovak Republic's exports is estimated to have increased from 41.7% to 47.7% - significantly above the OECD average of 26.7%.

The role of foreign final demand in domestic production

An alternative approach to evaluate participation in GVCs is to adopt a forward-looking perspective, such as the share of domestic value added driven by foreign demand (Figure 2). Overall, in 2020, 38.9% of the Slovak Republic's domestic value added was driven by foreign final demand, down from 41.3% in 2008 and above the OECD average of 29.8% in 2020. By industry, the shares ranged from *Motor vehicles* (96.2%) and *Basic metals* (89.4%) at the higher end to *Financial and insurance* (22.4%) at the lower end.

Figure 2. Slovak Republic - domestic value added in foreign final demand
As a percentage of value added, by industry, 2000, 2008 and 2020

The importance of imports for exports

The industries with the most foreign value-added contents in their exports (Figure 3a) were *ICT and electronics* (69.6%), *Motor vehicles* (68.9%) and *Coke and refined petroleum products* (65.9%). *Motor vehicles* generated the greatest source of domestic value-added content of total exports in 2020, accounting for 11.3% of total gross exports (Figure 3b), followed by *Wholesale and retail trade* (9.8%) and *Transport and storage* (4.5%). The most foreign content in total exports came from *Motor vehicles* (25.1%).

Figure 3a. Slovak Republic - foreign value-added content of gross exports

Figure 3b. Slovak Republic - industry share of domestic and foreign value-added content of gross exports
As a percentage of total gross exports, 2020

In 2020, 71% out of the total value of the Slovak Republic's imports of intermediate goods and services was subsequently embodied in exports (Figure 4), significantly above the OECD average of 44.5%, and above the share in 2008 (67.4%). The originating industries with the highest shares of intermediate imports used in the Slovak Republic's exports were *Motor vehicles* (94.1%), *Fabricated metal products* (81.3%) and *Rubber and plastics products* (79.9%).

As a percentage of intermediate imports, 2000, 2008 and 2020

International flows of goods and services: main players

In gross terms, Germany (15.9%), China (8.1%) and Czechia (8%) were the three most important Slovakian export market destinations in 2020 (Figure 5). The top three final destinations for the Slovak Republic's value added were Germany (14.3%), the United States (7.4%) and China (7.4%).

For imports in gross terms, the Slovak Republic's top three partners in 2020 were Germany (17.8%), Czechia (12.5%) and Poland (7.6%), while in value-added terms, the top three were Germany (13.9%), Czechia (9.2%) and the Russian Federation (7.6%).

Figure 5. Slovak Republic - main trade partners
As a percentage of total gross and value-added exports and imports, 2020

The importance of services in international trade

Services are a major contributor to the Slovakian economy, accounting for 50.9% of the Slovak Republic's gross exports in 2020 (Figure 6) - below the OECD average of 58.9%. Foreign services contributed 22.1% to the value of total gross exports. For manufactures, services value-added content was 37% of gross exports, with the highest shares in ICT and electronics (39.4%), Motor vehicles (39.2%) and Food and beverages (38.2%).

As a percentage of gross exports by industry, 2020

Foreign Input Reliance (FIR) and Foreign Market Reliance (FMR)

FIR and FMR indicators are based on gross output, rather than value added. They provide alternative perspectives of the importance of other countries and regions along value chains, and reveal the higher risk of disruption associated with longer foreign supply chains.

In 2020, the Manufacturing sector had the longest chain of foreign suppliers compared to other macroeconomic sectors: the foreign gross output used in the Slovak Republic's production represented 139.3% of its domestic gross output (Figure 7, left panel, FIR). In the same period, the Manufacturing sector had the longest chain of foreign clients: the Slovak Republic's domestic output used in foreign production represented 90.5% of its total domestic output (Figure 7, right panel, FMR). Due to the gross trade approach and the resulting double counting, the indicators can take values above 100%. Decomposing the foreign reliance in geographical contributions for all industries shows that other OECD countries represent 69.1% of the gross output reliance of the Slovak Republic with foreign suppliers, and 74.4% of the gross output reliance with foreign clients.

As a percentage of gross output, 2020

Environment and trade - embodied emissions

Figure 8. Slovak Republic - production-based and demand-based greenhouse gas (GHG) emissions
1995 to 2020, Million tonnes of CO₂ equivalent (Mt CO₂-eq)

The underlying ICIO tables, used to generate TiVA indicators, also enable the estimation of other indicators related to globalisation. For example, estimates of GHG emissions embodied in final demand provide an alternative perspective to measures of emissions from domestic production. Figure 8 highlights the difference between production-based and demand-based carbon emissions.

Between 2000 and 2019, the Slovak Republic's GHG emissions from domestic production fell by 18.4% (to 40 Mt). Over the same period, emissions embodied in the Slovak Republic's final demand for goods and services rose by 9.9% (to 47 Mt). In 2019, the Slovak Republic was a net importer of GHG emissions, with consumption being 7 Mt greater than production of emissions.

Employment and trade

ICIO tables can also be used to produce indicators related to employment and GVCs. The TiM database provides measures that can help address this topic, showing, for example, the extent to which exporting activities or foreign final demand sustain domestic employment used in production.

Out of all of the Slovak Republic's employment in 2020, 40.1% was engaged in production to meet foreign final demand (about 962 thousand persons), significantly above the OECD average of 27.4%, and close to the share in 2008 of 40.7% (Figure 9). The Slovakian industries with the highest shares of employment reliant on foreign final demand were *Motor vehicles* (96.2%), *Basic metals* (89.4%) and *Rubber and plastics products* (89%).

As a percentage of employment by industry, 2000, 2008 and 2020

Activities of multinational enterprises

The Analytical Activities of Multinational Enterprises (AMNE) database documents the contribution of multinational enterprises (MNEs) and their foreign affiliates to global production. The database encompasses both inward activities, those of foreign multinationals with affiliates in the country, and outward activities, those of domestic multinationals with affiliates abroad.

In the Slovak Republic, affiliates of foreign multinationals were responsible for 43.1% of the country's overall gross output in 2019. Conversely, the foreign affiliates of Slovakian firms produced a volume of output equivalent to 1.8% of the Slovak Republic's gross output (Figure 10).

COUNTRY NOTE GLOSSARY

1. Foreign value-added content of gross exports (TiVA: EXGR_FVASH)

Estimates the contribution to the total value of exports originating from foreign suppliers. It is often considered as a measure of 'backward linkages' in analyses of GVCs. Gross exports in TiVA exclude re-exported imports, i.e. imports that enter and exit a country without any further transformation.

2. Domestic value added in foreign final demand, by industry (TiVA: VALU_FFDDVA)

Presents, for a given country, the value added originating from that country's manufacturing and service industries that is embodied (via exporting activities) in foreign final demand - as a share of the total domestic value added generated by that industry. It can be considered as a measure of industry 'export orientation', as it shows the share of an industry's value added that ultimately meets foreign final demand (whether as a direct export or as an indirect export i.e. embodied in exports by other, downstream industries and countries).

3. Foreign value-added content of gross exports by industry (3a), and industry share of domestic and foreign value content of gross exports (3b) (TiVA: EXGR_FVASH, EXGR_TDVAIND, EXGR_TFVAIND)

Shows the foreign content share of gross exports by industries (3a) and a decomposition of total gross exports into the domestic and foreign value-added content exported by each industry (3b).

4. Imported intermediate inputs used for exports, by industry-origin of imports (TiVA: IMGRINT_REII)

Presents, for a given country, the share of intermediate imports from partners' industries that are used domestically in producing goods and services for export, as a percentage of total intermediate imports from partners' industries. The indicator provides a measure of the importance of intermediate imports to produce goods and services for export and their role as a source of international competitiveness.

5. Exports to and imports from main partner countries (TiVA: EXGRPSH, IMGRPSH, FFD_DVAPSH, DFD_FVAPSH)

Presents, for a given country, the share of total exports to, or total imports from, main partners as a percent of total export or imports in value-added and gross terms. Export figures do not include re-exports.

6. Services content of gross exports (TiVA: EXGR_SERV_DVASH, EXGR_SERV_FVASH)

Presents, for a given country, the contribution made by domestic and foreign services to exporting activities, at the total economy level and for specific goods-producing industries. It reveals the extent to which manufacturing industries, for example, rely on services as intermediate inputs into the production and export of goods.

7. Foreign Input Reliance (FIR) and Foreign Market Reliance (FMR)

The indicators account for both direct and indirect input trade flows between partner countries. The exact calculation relies on a gross trade approach: All industry-level direct and indirect gross trade flows between the destination country and its partners are normalized by the country's gross output, and then summed over all partners. The FIR is calculated by summing the foreign elements along each column of the Leontief matrix. Conversely, the FMR is computed by summing the foreign components along each row of the Ghosh matrix. Due to the gross trade approach and the resulting double counting, both indicators can take values above 100%. These indicators reflect that supply chain disruptions, such as natural disasters or geopolitical events, typically disrupt the entire shipment of a good rather than only the value added originating from a specific partner. In essence, FIR and FMR indicators measure the importance of trade partners in the value chain while implicitly accounting for the higher risk of disruption associated with longer supply chains.

8. Emissions embodied in domestic and foreign final demand (FD_CO2E, PROD_CO2E)

Production-based Greenhouse Gas (GHG) emissions are estimated by allocating the emissions, measured in carbon dioxide equivalent (referred as CO₂-eq and sometimes as CDE), to the 45 target resident industries in OECD ICIO and to household final consumption of fuels. Demand-based GHG emissions are calculated by multiplying the intensities of the production-based emissions with the global Leontief inverse and domestic final demand matrices from OECD ICIO. Thus, net emissions are defined as the difference between production-based emissions and domestic and foreign emissions embodied in domestic final demand.

9. Share of domestic employment embodied in foreign final demand (TiM: EMPN_FFDDDEM)

Presents, for a given country and industry, the domestic employment embodied in foreign final demand as a share of total employment in the industry. It is an indicator of the intensity of trade reliance of a specific sector's employment.

10. Inward and outward MNE activities

Expresses the overall gross output of the affiliates of foreign multinationals in the country and that of the affiliates of domestic multinationals abroad, respectively. A foreign affiliate is an enterprise in which more than half of the shares are controlled, directly or indirectly (e.g. through another affiliate), by an entity residing in another country. These indicators are expressed as a share of the gross output of the domestic economy.
